(一) 金屬工業發展中心

地　　址：

中心所在地——高雄市楠梓區高楠公路 1001 號

臺北辦事處——臺北市懷寧街七十號

電　　話：高雄21128；臺北35874，37955，38376

成立經過：該中心成立於民國五十二年十月，由中華民國政府，聯合國特別基金會及國際勞工局聯合辦理。其目的在對我國基本金屬、金屬處理、機器、交通器材、電器用具等之製造業等予以發展及改進。

組織系統：

訓練人員：訓練部門設主任一人，現有職員65人，技工17人，共計83人，教員均係兼任。

主要訓練場所設及備：

課　棹　椅	60 套
電子教具	9 套
實驗工廠	1 座
鑄造工廠	1 座

舉辦訓練：該中心訓練科目之安排係按工廠調查或工業界之實際需要而定。訓練之範圍從高層經理人員到領班，監工及技士，包括技術及管理課程。

從五十二年十月至五十五年六月底止，金屬工業發展中心共舉辦五十九班，其中60%即三十六班係屬管理課程方面者，其中40%即二十三班係屬技術方面者。同時在此期間中舉辦了十七班在廠訓練班。

所有之訓練共有 1,363 人參加，其中27%即 368 人係屬管理人員；73%即 995 人屬工程師及技士。其中值得注意者爲大多數的參加者爲工程師及技師，雖說事實上訓練班的管理課程超過技術課程20%。至於在廠訓練班共計有 495 人參加。

就訓練所使用之時數言，共用去 2,388小時，其中28%即669小時在臺北區舉辦，72%即 1,719 小時在高雄舉辦。除此之外，在廠訓練共使用 579 小時。

班　別	班數	時數	參加人數
1. 金屬工業管理	2	40	51
2. 管理教育之設計與模擬	1	27	13
3. 電子爐操作	1	15	31
4. 輾製技術講習會	1	18	16
5. 量度訓練	2	50	46
6. 鋼鐵鑄造技術	1	35	61
7. 塑膠金屬模型製造講習班	2	30	35
8. 管理控制報告表單之設計與使用	2	56	43
9. 潤滑講習班	2	48	58
10. 鋼鐵工業品質管制講習班	1	26	10
11. 新計劃之設計與控制講習班	2	40	27
12. 銷售控制講習班	2	30	37
13. 製鋼工業講習班	3	60	27
14. 市場講習班	2	40	42
15. 督導人員訓練	3	355	66
16. 在廠訓練講習班	1	14	17
19. 領班人員訓練班	8	512	194
18. 熱處理講習班	1	30	31
19. 工作研討講習班	3	348	47
20. 電子資料處理介紹	1	25	25
21. 訓練人員講習會	1	40	13
22. 工具模型之設計與製造講習班	3	104	68
23. 齒輪之設計與製造講習班	3	95	68

24. 候補領班人員講習會	3	120	67
25. 防護保養系統之設計與實施	2	84	60
26. 一般管理	2	36	51
27. 公差制度與互換製造	2	40	32
28. 鑄造技術座談會	1	28	106
29. 講師訓練班	1	42	21
總　　計	59	2388	1363

歷屆舉辦在廠訓練班次及人數表（五十二年十月至五十五年六月）：

類　別	班　數	參加人數
1. 高級管理研討會	2	75
2. 監督及領班人員等講習班	12	368
3. 工業工程課程講習班	3	52
總　　計	17	495

（二）中國生產力及貿易中心

地　　址：臺北市西寧南路六十二號

電　　話：48631

成立經過：民國四十四年成立，初名中國生產力中心，爲一非營利性之民間機構，其目的在向工商界提供管理咨詢與技術服務，以求生產力之提高。

民國四十五年臺南區服務處成立。

民國四十八年增設貿易推廣部，該機構名稱亦更改爲中國生產力及貿易中心。

民國四十九年設立陶業訓練所，以發展陶器工業。

組織系統：中心之最高機構爲董事會，有董事二十一人，由政府機關，工商團體，勞工組織，教育機關與資方公會之有關人士組成，現任董事長爲金開英，總經理（吳道艮）主持實際業務，下分生產力部，貿易推廣部與公共業務部三部及臺南區服務處。其組織系統表如下：

訓練人員：該中心之訓練工作由生產力部下之訓練組負責辦理，現有專任組長一人，職員十人，技工一人，共計十二人，教員係隨需要由中心同人及外界專家中遴聘，無專任教員。

主要訓練場所與設備：

教　　室	3間（冷氣）可容130人。
圖　書　館	1間（藏書 12000 餘冊，雜誌 100 餘種）
辦　公　室	1間
會　議　室	2間
陶器試驗室及工場各	1間

電影放映機	3部
電　影　片	130部
幻　燈　機	4部
幻　燈　片	30套
錄　音　機	3部

訓練實施情形：

㈠依訓練性質分，民國四十四年至五十三年，十年間訓練班次與學員人數如下：

訓練性質	班　數	學員人數
管理發展	29	1370
工業工程	214	6938
技　　術	86	2454
財務與會計	21	709
貿易與市場	24	839
其　　他	23	686
共　　計	397	12996

㈡近三年來（民52-54年）所舉辦之訓練：

訓練班名稱	班　數	結訓人數
染整技術與管理講習班	5	142
紡織工業管理研討會	1	35
現代企業管理研討會	5	435
企業管理概要講習班	5	173
電腦管理學講習班	1	77
金屬工業管理研討會	2	51
提高生產力講習班	2	86
領班人員訓練班	1	36
工業工程概要講習班	2	83
品質管制訓練班	89	2943
工作研究訓練班	19	566
抽樣檢驗訓練班	11	282
工業安全訓練班	6	203
生產計劃與管制訓練班	3	118
預防保養訓練班	8	295
物料管理訓練班	4	145
工作抽查訓練班	9	265
製革技術訓練班	3	76
鋼鐵熱處理訓練班	2	43
木器裝飾訓練班	1	21
肥皂清潔劑製造技術班	1	41
化粧品製造技術班	1	25
包裝技術訓練班	7	212

工業設計訓練班	6	180
陶瓷技藝訓練班	10	162
耐火材料講習班	6	208
彩色印刷訓練班	5	96
印刷技術訓練班	2	43
成本會計訓練班	2	85
怎樣閱讀會計	4	122
成本分析講習班	3	105
市場推銷研討會	4	143
高級市場推銷研討會	1	21
市場推銷複習研討會	1	35
貨物流通研討會	2	96
貿易推廣技術研討會	1	46
國外商務及貿易推廣訓練班	3	168
英文商用函件訓練班	9	331
共 計 班 次	247	8194

㈢依職業別，歷年來之結訓人數：

	專門及技術人員	行政及參管人員	領工技工半技工
45年	292		
46年	798	357	
47年	467	213	
48年	900	154	
49年	389	746	
50年	599	334	
51年	1,750	495	
52年	2,637	551	86
53年	1,576	654	
54年	1,884	770	36
共計	11,292	4,274	122

（三） 國立政治大學公共行政及企業管理教育中心

地　　址：臺北市金華街 187 號

電　　話：39546

設立經過：該中心設立於民國五十一年，其目的在訓練政府機構人員以及工業界之管理人員。自五十一年至五十四年該中心與美國密西根大學合作辦理在職訓練，該中心設有訓練組負責訓練工作。

訓練人員：講師均係由校內外之專家遴選擔任，無專任講師。

舉辦訓練：1. 迄至民國五十四年底爲止，該中心已舉辦66班，參加人數2096人，迄至民國五十五年七月，則已達91班，參加人數3253人。

訓練班性質	班　數

(四) 臺灣電力公司員工訓練所

地　　址：臺北縣新店鎮龜山路 20 號

電　　話：新店龜山電信局轉

成立經過：該中心成立於民國四十年，位於新店龜山，距臺北市21公里，民國四十二年在臺中設立分班，民國四十六年在高雄設立分班，前者與省立臺中高級工業職業學校合作，後者與省立高雄高級工業職業學校合作。

組織系統：

訓練人員：訓練所主任爲張澤仁，有專任職員12人，專任技工12人，共25人，講師係依課程需要，聘請公司內外專家擔任，無專任講師。

主要訓練場所與設備：

教　　室	4 間
工　　場	1 間
實 驗 室	1 間
圖 書 館	1 間
健 身 房	1 棟
受訓人宿舍	4 間
辦 公 室	2 間
會 議 室	1 間
禮　　堂	1 間
講師宿舍	1 棟
外線實習場	1 處
總 面 積	2500 坪
車　　床	5 台

鉋床、鑽床、鐵鋸床、砂輪床、電動洗管器、空氣壓縮機、定盤、絕緣油試驗器、接地電阻試驗器、水銀整流器各 1 台

枱 虎 鉗	14 件
電動發電機	6 座

（上述建築場地不包括高雄及臺中分班）

訓練實施情形：五十二年至五十四年共辦理 498 班，參加者共 7885 人，其中有 392 班爲 T. W. I. 訓練，參加者 3843 人。

訓練班名稱	班　數	結訓人數

(五) 臺灣機械公司訓練委員會

地　　址：高雄市公園二路25號

電　　話：21171

成立經過：該公司於四十二年十一月設置員工訓練委員會，辦理訓練事宜，在該會成立之初，實施大專學生獎學金辦法，與職業學校建教合作及辦理高級技術員出國實習，四十四年起開辦藝徒訓練班，四十五年起依據工廠工作需要舉辦各種技能訓練班與管理人員講習班，以訓練在職技工及管理人員。

組織系統及訓練人員：訓練委員會設主任委員(現任主任委員爲陳喜棠)，其下設執行秘書，各種訓練班設班主任、講師、技師及助理技師等。班主任、講師、技師，助理技師等均於舉辦訓練班或講習班時臨時選聘適當人員擔任。

主要訓練場所與設備：有教室二間，可容69人，及辦公室1間，其他設備均係利用該公司之有關工場設備。

訓練實施情形：

㈠近三年（52-54年）來辦理之訓練班如下：

訓練班名稱	班　數	結訓人數
鍍片技工訓練班	2	78
技工第二技能訓練電焊訓練班	3	62
技工第二技能訓練冷作訓練班	3	67
檢驗人員訓練班	1	33
鑄造技術訓練班	1	60
第三階層主管人員訓練班	2	89
業務常識講習班	1	25
金屬研磨訓練班	1	27
技工第二技能訓練吊車司機訓練班	4	16
技工第二技能訓練電爐操作訓練班	1	11
督導人員訓練班	1	30
工廠工作人員訓練班	4	92
共　　計	24	596

(六) 中國石油公司員工訓練中心

地　　址：嘉義市吳鳳路23號
電　　話：3070
成立日期：民國五十二年五月一日
組織系統：

訓練人員：現有專任訓練中心主任一人（劉魁餘），專任職員12人，技工2人，教員係視課程需要聘請公司內外專家擔任，無專任教員。

主要訓練場所設備：

教　　室	2 間（可容 100 人）
實 驗 室	2 間（一爲自動儀器室，一爲電子儀器室）
圖 書 館	1 所
受訓人宿舍	20 間（可容80人）
會 議 室	2 間
禮　　堂	1 間（80人）
講師宿舍	2 棟（可容10人）
教學器材模型陳列室	1 間
運 動 場	136 坪
總 面 積	6000 坪
電子控制訓練器	3 部
自動控制訓練儀器	1 套
各種電化教學輔助	10 套
油料消防演習場	1 處

訓練實施情形：

自五十二年至五十四年之三年中共辦四十個訓練班，參加者計一千二百十一人，均爲本公司之員工，每班平均訓練時間約爲一週，茲分別如下：

訓練班名稱	班　數	結訓人數
職位分類講習班	1	52
新進人員講習班	5	270
企業管理講習班	7	89
加油站業務講習班	3	137
退役轉業人員講習班	2	76

領班人員業務講習班	2	62

（八） 臺灣省公路局汽車技術員工訓練中心

地　　址：臺北縣中和鄉積穗村

電　　話：92-2390・92-2441

成立經通：民國四十三年四月我國政府接受亞洲暨遠東經濟委員會提高亞洲各國汽車修護駕駛技術建議與聯合國國際勞工局技術合作，由該局供應值美金一萬二千元之機具，及汽車修理保養專家二人，設立汽車技術員工訓練班於中和鄉及北投，四十九年遷入現址，五十一年取得聯合國特別基金會協助，擴大辦理柴油機械及重機械訓練，同年更名爲臺灣省公路局汽車技術員工訓練中心。

組織系統：

訓練人員：主任副主任各一人。

專任講師21人。

外籍專家 6 人。

職　　員33人。

主要訓練所與設備：

土　　地	9400 坪
房　　屋	1448 坪
學員容量	200 人
班次容量	7 班
機　　器	115 具
教練車及實習車	29 輛
實習引擎	42 具
模　　型	124 件
試驗器	53 件
儀　　器	276 件
工　　具	357 組
駕駛訓練器材	12 件
訓練叢書	45 種
圖　　表	2300 張
着色三夾板圖解	150 張
輔助訓練教材	80 種
參考書籍	2140 冊
技術電影幻燈片	735 捲
視聽器具	42 具

訓練實施情形：

1. 汽車系——分師資班、研究班、監導班、機務管理班、機務研究班、修理班、修理複訓引擎班、修理複訓電氣班、修理複訓底盤班、大客車駕駛保養班、小客車駕駛保養班，貨車駕駛保養班，技工班、初級技工班、檢驗電器專業班及柴油引擎燃料機械專業班、每班訓練期間 2–26 星期不等。
2. 柴油機系——分師資班、研究班及監導班、每班訓練期間爲8–12星期。
3. 重機械系——分師資班、研究班及監導班、每班訓練期間爲8星期。

截至五十四年十二月底止，十一年來已舉辦 268 班，結訓人數達8280人。

送訓機構：達 329 個單位，其中以公路局，公車管理處，國軍退除役官兵就業輔導委員會及公營機關較多，民營運輸機構以新竹、興南、彰化、員林、桃園、臺南、豐原客運公司較多。

訓練績效：據該中心稱，績效中有車輛使用壽命由 250000 公里增至 500000 公里，電瓶使用壽命由 4 個月增至 1 年，輪胎使用壽命由 25000 公里增至 110000 公里，引擎大修後使用里程由 30000 公里增至 110000 公里，汽油消耗每公升由 2.5 公里增至 3.5 公里等。

（九） 臺灣省建設廳管理技術發展中心

地　　址：臺北市鎮江街2號

電　　話：臺北市 28169

成立日期：民國四十五年二月，隸屬於臺灣省政府建設廳，聯合國及國際勞工局給予協助，以從事企業工作領導人員在職訓練爲目的。

組織系統：

企業工作領導人員在職訓練現行系統圖

訓練人員：建設廳副廳長（李炳齊）兼任中心主任，楊其敏任總幹事，教員係兼任人員。

訓練課程：
1. 工作教導
2. 工作關係
3. 工作方法
4. 如何主持討論會
5. 工作考成
6. 如何發展訓練計劃

舉辦訓練：自民五十二年至五十四年，三年間曾舉辦597個班次，參加訓練人數達5506人，各種教材，係來自美國（在職訓練基金會）

(十) 臺灣省訓練團

地　　址：南投縣中興新村光明路1號
電　　話：575
成立日期：民45年7月，專爲訓練省政府各級機構人員設立。
組織系統：

訓練人員：團主任由省主席兼任，教育長由杭世騏擔任。
　　下設專任主任秘書1人，專任教員15人，專任職員112人及專任技工14人。
訓練場所及設備：

總面積	29343 坪
運動場	7680 坪
教室	11 間（可容750人）
圖書館	1 所
學員宿舍	75 間（可容700人）
醫務室	3 間
辦公室	23 間
會議室	1 間
禮堂	1 間（可容800人）
講師宿舍	1 幢

舉辦訓練：1. 三年（民52-54年）來辦理之訓練，共計218班，14122人。

性質	班數

53年	50
54年	80
共計	297

(1) METAL INDUSTRY DEVELOPMENT CENTER

LOCATION:

Head Office: 1001, Kao-Nan Highway, Natzu, Kaohsiung

Taipei Office: 70, Hwaning St., Taipei City

TELEPHONE: 21128 Kaohsiung; 35873, 37955, 38376 Taipei

ESTABLISHMENT: This Center was established in October 1963 as a joint operation of the Republic of China, the United Nations Special Fund and ILO for the development and improvement of our basic metal treatment, machinery, transportation and communication equipment and electric appliance industries.

MIDC ORGANIZATION CHART

TRAINING PERSONNEL:

Under the Chief of Training Division, there are 65 staff members and 17 technical workers. Instructors are on temporary basis.

TRAINING FACILITIES:

Desks and Chairs	60 sets
Visual Aids	9 sets
Work Shop	1
Foundry Shop	1

TRAINING CONDUCTED:

Training courses are conducted as deemed necessary from factory surveys or specific requests from industry.

Courses extend from top management through to foremen, supervisors and technicians and cover both technical and managerical subjects.

From October, 1963 to the end of June, 1966, MIDC sponsored 59 seminars and training classes of which 36 or 60% were of management, 23 or 40% were of technological courses. In addition 17, in-plant training classes were conducted during the period.

There were altogather 1,363 participants, of whom 364 or 27% are management personnel; 999 or 73% are engineers aud technicians.

It is interesting to note that there was an over whelming majority of participants being engineers and technicians in spite of the fact that training classes on management exceeded technological courses by 20%. As to the in-plant training classes, there were 495 participants.

Implementation of the programs called for 2,388 hours, of which 688 or 28% were for the Taipei area, while 1700 or 72% for the Kaohsiung area. Besides, 579 hours were spent in in-plant training.

Item	No. of Classes	Hrs.	No. of Participants	Remarks
1. Management for Metal Industries	2	45	51	
2. Seminar on the Design and Simulation in Management Education	1	27	13	
3. Seminar for Electronic Arc Furnace Operation	1	15	31	
4. Seminar on Rolling Technique	1	18	16	
5. Measurement Training Course	2	50	46	
6. Seminar on Foundry Technique of Iron and Steel for TMMC	1	35	61	
7. Plastics Mold Engineering Training Course	2	30	35	

8. Seminar on Design and Use of Management Control Report	2	56	43
9. Seminar on Lubrication and Lubricant	2	48	58
10. Seminar on Quality Control of Steel Industries	1	26	10

(2) CHINA PRODUCTIVITY AND TRADE CENTER

LOCATION: 62 Hsinuing South Road, Taipei City

TELEPHONE: 48631

ESTABLISHMENT AND GROWTH OF THE INSTITUTION:

The China Productivity Center was first founded in 1955 for the promotion of industrial productivity by providing a variety of administrative consultation and technical services.

In 1956 the branch office in Tainan was established.

In 1959 a Trade Promotion Division was incorporated into the Center and The Center's name was changed to the China Productivity and Trade Center.

In 1960 a Ceramic Training Institute was established specially to help developing the ceramic industries.

STRUCTURE OF THE ORGANIZATION:

The Board of Directors is the highest authority of the center which was composed by 21 directors, representing industrial and commercial associations, trade unions, educational agencies and the employers' associations, The current chairman of the board is Mr Ch'in Kai-szu.

The general manager is in charge of practical operation and under him there are three divisions—General Service, Trade Promotion, Productivity and the Tainan Branch.

STRUCTURE OF THE ORGANIZATION:

The Training Section is allocatd in the Productivity Division of CPTC. which is responsible for planning, coordinating and implementing all the training programs.

TRAINING PERSONNEL:

There are ten staff members and one technician under the supervision of the Chief of Training Section. Instructors are invited from outside experts and appropriate personnel of the CPTC. There is no permanent instructor.

TRAINING FACILITIES:

Classrooms 3 (air-conditioned, capacity; 130 persons)

Library 1 (Over 12,000 volumes of books)
Office 1
Conference Room 1
Ceramic Institute 1 (with 1 lab. and 1 workshop)
Movie Projectors 3
Films 130
Slide Projectors 4
Slides 30 sets
Recorders 3

TRAINING CONDUCTED:

(1) From 1955 to 1964, the following kinds of training were conducted:

Item	No. of Classes	No. of Participants
Management Development	29	1,370
Industrial Engineering	214	6,938
Technology	86	2,454
Finance and Cost	21	709
Trade and Marketing	24	839
Misc.	23	686
Total	397	12,996

(2) Courses conducted during the recent 3 years (1963–65)

TITLE	No. of Classes	No. of Participants
Textile Dyeing and Finishing Technique Seminar	5	142
Txtile Industry Management Seminar	1	35
Modern Industrial Management Seminar	5	435
Industrial Management Introductory Course	5	173
IBM Management	1	77
Metal Industry Management Seminar	2	51
Promoting Productivity Course	2	86
Foremen Training Class	1	36
Industrial Engineering Introductory Course	2	83

(3) PUBLIC ADMINISTRATION AND BUSINESS MANAGEMENT DEVELOPMENT CENTER, NATIONAL CHENGCHI UNIVERSITY

LOCATION; 187-1 Ching-hwa St., Taipei City

TELEPHONE: 39546

DATE OF ESTABLISHMENT AND GROWTH:

It was established in 1962 for the Purpose of training personnel of governmental agencies as well as those of industries in the field of management.

From 1962 to 1965 it cooperated with Michigan University., U. S. A. in its in-service training.

The Training Division of the Center is responsible for training.

TRAINING PERSONNEL:

Instructors are invited on subject basis. There is no full-time instructor in the Center.

TRAINING CONDUCTED:

1. From 1962 to 1965 the Center had conducted 66 classes or seminars with total of 2,906 participants. Up to July 1966, 91 classes and seminars have been conducted, with 3,235 Persons participated.

(4) TRAINING CENTER
TAIWAN POWER COMPANY

LOCATION: Kwei-shan Road, Shin-Tien Chin, Taipei Hsien, Taiwan.

TELEPHONE: Via Shin-Tien Telephone Office

ESTABLISHMENT AND GROWTH OF THE INSTITUTION:

The Center was established in 1951 in Shin-Tin Chin which is about 21 k.m. from Taipei City. In 1953 the Taichung Branch was established and in 1957 the Kaohsiung Branch was established too. The former was in cooperation with Taichung Senior Industrial Vocational School and the latter was in cooperation with the Kaohsiung Senior Industrial Vocational School.

STRUCTURE OF THE ORGANIZATION:

TRAINING PERSONNEL:

The present Director of the Center is Mr. C. Y. Chang. Under him there are 12 staff members and 12 technicians. Instructors are invited on course basis from outside sources and the Company's own personnel. There is no permanent instructor.

TRAINING FACILITIES:

Classrooms	4
Work Shop	1
Lab.	1
Library	1
Gym	1
Trainees Dorm.	4
Office	2

(8) AUTO TECHNICIANS AND INSTRUCTORS TRAINING CENTER TAIWAN HIGHWAY BUREAU

LOCATION: Tsi-Sai Village, Chung-Ho Hsiang, Taipei Hsien (about 12 Km. from Taipei City)

TELEPHONE: 92-2390, 92-2441

ESTABLISHMENT AND GROWTH:

The Center was established in 1954 under the jurisdiction of National Highway Administration, Ministry of Communications with technical assistance from the International Labour Organization. In 1962, the Center was re-assigned under the administrative control of Taiwan Provincial Highway Bureau, Dept. of Communications of Provincial Government of Taiwan.

UN Special Fund of US$657,000 and Government's counterpart Contribution of US$552,000 were granted in 1962 for its 4-year expansion project which is now under way.

STRUCTURE OF THE ORGANIZATION:

TRAINING PERSONNEL:

There are 1 director, 1 asst. director, 21 full-time instructors, 6 foreign experts, and 33 staff workers.

TRAINING FACILITIES:

The campus consists of 9,400 ping of land with buildings of 1,448 ping floor space which can accomodate 200 trainees or 7 classes.

Other facilities are:

Machines	115
Practice vehicles	29
Practice engines	42
Models	124
Experimental equipment	53
Demonstrating Apparatuses	276
Tools	357 sets

Driver's Training Instruments	12	
Training Manuals	45	series
Exhibiting Tables	2,300	Colored
Exhibiting Boards	150	
Training Materials	80	kinds
Reference Books	2,140	
Slides	735	rolls
Audio-visualAids	42	

TRAINING CONDUCTED:

Up to Dec. 1965, 298 classes of training have been conducted with a total of 8280 trainees. Duration of each class was from 1 week to 26 week. Mainly there are three sections of training:

The Auto Section,

The Diesel Engine Section, and

The Heavy Equipment Section.

The average time spent for lecture for each class was about 24% for practice 43%, and for review, audio-visual aids and tests, 33%.

ACHIEVEMENTS:

Among the achievements, the Training Center reported, average life of vehicles prolonged from 250,000 k.m. to 500,000 k.m., average service life of engines after overhaul prolonged from 30,000 k.m. to 110,000 k.m., average battery life prolonged from 4 months to one year, average tire life prolonged from 25,000 k.m. to 110,000 k.m., and average gasoline mileage of bus increased from 2.5 km/liter to 3.5 km/liter.

(9) MANAGEMENT DEVELOPMENT CENTER, DEPARTMENT OF RECONSTRUCTION, TAIWAN PROVINCIAL GOVERNMENT

LOCATION: 2 Cheng Kiang Street, Taipei City

TELEPHONE: 28169 Taipei

DATE OF ESTABLISHMENT:

This Center was established in February 1956 under the jurisdiction of Department of Reconstruction, Taiwan Provincial Government with the assistance of the United Nations and the International Labour Office, for the main objective of introducing Training Within Industry (TWI) program in Taiwan.

STRUCTURE OF ORGANIZATION:

Management Development Center ..... Participating Agencies

ILO Experts ..... Institute Conductors .....
|
Sessions ..... Trainers .....
|
Groups ..... Supervisors .....
in each agency
|
Employees & Workers .....

TRAINING PERSONNEL:

Director of the Center is the Vice Commisioner of the Department of Reconstruction (Mr. P. C. Lee.) The Executive Secretary is Mr. C. M. Young. Institute Conductors and Trainers are invited on part-time basis.

TRAINING COURSES:

1. Job Instruction
2. Job Relations
3. Job Methods
4. How to preside over a meeting
5. Job Inspection
6. Program Development

TRAINING CONDUCTED:

From 1963 through 1965, there were 579 classes conducted with 5,506 persons attended. All the teaching material came from "Training within Industry Foundation" in U. S. A.

(10) TAIWAN PROVINCIAL TRAINING CORPS

LOCATION: 1 Kwan-ming Road, Chungshing Village, Nantou

TELEPHONE: 575

DATE OF ESTABLISHMENT:

July 1956. This is a training center for provincial government personnel of all levels.

STRUCTURE OF ORGANIZATION:

TRAINING PERSONNEL:

Governor C. Huang is concurrently the director of the corps and the Dean is Mr. Chang Kuo-Chiang under them, are the chief of secretariate, 15 instructors, 112 staff and 14 technicians. All of them are permanent personnel.

TRAINING FACILITIES:

Total area of the campus	29,343 ping
Athletic ground	7,680
Classrooms	11 (capacity: 750 persons)
Library	1
Trainees Dormitories	75 rooms (capacity: 700 persons)
Medical Clinic	3
Office Rooms	23

Profiles of Trade and Technical Leaders: Summary Report.

California Univ., Los Angeles. Div. of Vocational Education
California State Dept. of Education, Sacramento. Bureau of Industrial Education
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 69 60p.

*ADMINISTRATOR CHARACTERISTICS; *ADMINISTRATOR BACKGROUND; TECHNICAL EDUCATION; EDUCATIONAL PROBLEMS; STATE SURVEYS; *ADMINISTRATIVE PROBLEMS; *TRADE AND INDUSTRIAL EDUCATION
CALIFORNIA

To provide descriptive information concerning trade and technical education leaders in California, a series of three questionnaires was used to collect data from over 200 persons and interviews were held with 30 who were randomly selected. Findings included: (1) median age was 48.56 years, (2) over 50 percent held M.A. degrees, (3) most were married, (4) median work and teaching experience was 10.31 years and 7.82 years respectively, (5) the median salary was $15,344 (6) about 85 percent spent all their time in coordination, supervision, and administration, and (7) meetings, report writing, and coordination are most oftern reported activities. Fifteen major issues were identified and 10 solutions were rated by 239 leaders. Some of these issues and highest rated solutions were: (1) The status of vocational education can be improved by orienting counselors to its values, (2) Federal efforts can be more effective by increasing flexibility, (3) Publicity can help bring vocational education into the educational mainstream, (4) The shortages of qualified vocational education teachers can be resolved by inservice education, (5) Relationships between academic and vocational education teachers can be improved by involvement in the counseling program. This is a summary of a report by the same title which is available as ED 019 457. (EM)

FOREWORD

The Profiles Study of trade and technical leaders extends the study of trade and technical educators. Profiles of Trade and Technical Leaders can now be placed alongside Profiles of Trade and Technical Teachers which was previously prepared by the Division of Vocational Education at UCLA in cooperation with the Bureau of Industrial Education. Together these studies are putting together a description of trade and technical educators which have never before been available.

This research has been needed for a long time. It provides facts to document descriptions of trade and technical leadership. It describes how trade and technical leaders spend their time and what they think about major issues. It identifies the factors which influence their thoughts and actions. It describes their professional advancement.

These data will be used wherever appropriate in California and throughout the nation to further the cause of trade and technical education. They help answer many questions which are being raised today and provide direction for meeting the needs of tomorrow.

I am grateful to all of the leaders who have given their assistance to this research project.

THE PROFILES STUDY

Few depth studies of the characteristics of vocational educators have been made. During the years of 1966 - 1968, however, a study of trade and technical teachers credentialed to teach full-time in California was conducted at UCLA under the sponsorship of the Bureau of Industrial Education of the California State Department of Education.[1]

During 1967 - 1968 the Bureau continued to sponsor the study of trade and technical educators by expanding the research to full-time leaders of trade and technical education in California. The term "leader" in this study is generously used to describe persons with a variety of titles such as coordinator, director, supervisor, dean, consultant, etc.

Population

Names of persons to be included in the study were supplied from the Bureau of Industrial Education. Names of leaders in correctional institutions were supplied by the Department of Corrections. The first survey questionnaire used in the study, the Basic Description Questionnaire (BDQ), was designed to identify those persons who supervised, coordinated, directed or acted as consultant for trade and technical

---

[1]The three reports published on the Profiles Study of trade and technical teachers are entitled (1) Profiles of Trade and Technical Teachers: Summary Report--1967, (2) Profiles of Trade and Technical Teachers: Comprehensive Report--1968, and (3) Profiles of Trade and Technical Teachers: Revised Summary Report--1968. The Comprehensive Report provided a very detailed analysis not included in the Summary Report. The Revised Summary Report included a larger population than the original summary.

programs more than fifty percent of their time. The BDQ was sent to 389 persons thought to be in the population. Three hundred and fifty-eight persons returned the questionnaire but 72 of the returns were deleted from the study because they did not meet the parameters of the study. Two hundred and eighty-six valid returns were used to comprise the data from the BDQ.

The population was not limited to educators with backgrounds in trade and technical education. Persons who provide the leadership for trade and technical education in California have a variety of backgrounds in general education, industrial arts, trade and technical education and other vocational areas. In brief, all persons who "call the shots" in trade and technical education below the level of general administrative officials were included in the study.

Research Methods

Three questionnaires and thirty interviews were utilized in the course of the research. The BDQ was utilized to collect descriptive information about the characteristics of the leader population, to explore the relationships of numerous variables and to identify the population.

The data from the BDQ are based on 286 returns. If the 31 persons who did not return the questionnaire are assumed to be in the population these comprised a 90 percent return.

The Work Analysis Forms (WAF), an instrument developed by the Ohio State Leadership Studies in the Bureau of Business Research, was

used to provide a modified form of job analysis.[2] The WAF is designed to identify various aspects of administrative performance by recording estimates of the time that the subject spends in various kinds of work.

The WAF was sent to all 286 respondents to the BDQ. The data from the WAF were collected from 224 returns (79 percent).

Fifteen major issues were identified for consideration by trade and technical leaders and incorporated in a questionnaire entitled the Major Issues Questionnaire (MIQ). Nine issues were identified by Grant Venn in his book, Man, Education and Work.[3] Some of these same issues and six additional issues were identified by thirty leaders interviewed throughout California. Suggestions for the solution of these issues were solicited from the thirty interviewees (randomly selected from the list of 286 respondents to the BDQ) and ten suggestions for the solution of each major issue were offered to the entire sample in the MIQ. The leaders were asked to score the importance of each suggestion on a five point scale of helpfulness.

The data from the MIQ are based on a return of 239 returns (84 percent).

Limitations of Summary Report

The Summary Report is limited to general overall descriptions of the population of trade and technical leaders. The Comprehensive

Report, on the other hand, examines the relationship of numerous variables (e.g., teaching background, type of institution, education, career patterns, type of authority, etc.) to the overall population and particular subgroups.

BASIC DESCRIPTION

The data reported on the following pages were collected by the Basic Description Questionnaire. The BDQ was designed to collect the most frequently requested information about trade and technical leaders to provide a "profile" of characteristics and to explore the relationships of numerous variables.

The data from the BDQ are based on 286 returns. If the 31 persons who did not return the questionnaire are assumed to be in the population (some of those who did return the questionnaire were not) these comprised a 90 percent return.

SUMMARY

Numerous generalizations, characterizations and relationships can be discerned from the data reported in the preceeding pages of this Summary Report and other data reported in the Comprehensive Report. In addition, the data gathered with the Basic Description Questionnaire reflect varying career patterns and patterns of organizational affiliation.

For example, the following descriptions can be made about trade and technical leaders in California:

> Most of the leaders are white, Protestant, married males in their late forties. They begin teaching in their late twenties, enter administration in their late thirties and have a median age of 48.56 years.
>
> About six out of ten (61.54 percent) are employed by schools or districts with 50,000 or more citizens. More leaders work in metropolitan areas (46.51 percent) than in independent towns and cities (31.17 percent).
>
> Almost half of the leaders (47.92 percent) work for junior college districts, 18.33 percent work for high school districts and about one in ten (9.17 percent) work for correctional institutions. County offices and the State Department of Education account for the remainder.
>
> They are most frequently titled "coordinators" (27.97 percent), but "director" (17.13 percent), "supervisor" (15.73 percent) and "dean" (15.73 percent) are also common.
>
> More than eight out of ten (84.96 percent) spend 100 percent of their time in coordination, supervision and/or administration.
>
> Most of them (86.84 percent) have "across the board" responsibility. Half of these have

authority to direct and control programs and half have responsibility to recommend changes only.

The trade and technical subject areas most frequently associated with their work are metals programs (73.78 percent), electricity/electronics (73.08 percent), automotive (69.23 percent), drafting (67.48 percent) and the building trades (59.44 percent).

They have a median of 7.82 years of teaching experience; however, the range extends from no teaching experience to 30 years.

They have a median of 10.31 years of work experience in subject areas related to vocational education but the range extends from no work experience to almost 40 years.

Trade and technical educators invest large amounts of energy in formal education while employed in education. For example, 59.08 percent have bachelor, master or doctoral degrees when they start teaching, but three-quarters (75.17 percent) have them when they start supervision and/or administration and eight out of ten (81.82 percent) currently have one of these degrees.

Younger administrators are entering vocational education with more education than their older colleagues and they are working toward more degrees.

They have a median salary of $15,344. The range extends from $10,000 to about $30,000. Approximately three-quarters (72.37 percent) are on yearly contracts. About one-fifth (19.58 percent) report additional income from other educational sources and about one-fourth (25.53 percent) report income from non-educational sources.

Different career patterns are most easily discernable when work experience, teaching backgrounds, education, institutional employment and credentials are examined.

The most common career route to a position of leadership in trade and technical education begins in the world of work as a

craftsman or technician, continues with a teaching position in the world of education and advances into the coordination, supervision and/or administration of vocational education. The best single indication of this is the teaching background of the leaders. More than half (55.59 percent) of our sample have taught trade and technical subjects. Those who follow the traditional trade and technical career route tend to have more work experience, less formal education (especially when they begin to teach) and obtain more limited, special purpose credentials and fewer comprehensive, general credentials.

The second most common career pattern (16.43 percent of the sample) is that of the general educators. This group usually has little or no work experience in trade and technical subject areas, has taught academic rather than trade and technical subjects, has the most formal education and obtains the least number of credentials. Their credentials are almost always comprehensive in scope.

The industrial arts group is the third most common type in our sample (14.69 percent). They have less work experience than the traditional trade and technical group, have taught industrial arts courses, have considerable formal education and the largest number of credentials of any group. Their credentials are a mixture of general purpose and special purpose credentials.

One-tenth (10.14 percent) of our sample are leaders with teaching backgrounds in other types of vocational subjects (e.g., business education, agriculture, etc.). They frequently have work experience in vocational subject areas other than trade and technical.

They obtain a mixture of general purpose and special purpose credentials although they acquire fewer credentials than the industrial arts or trade and technical group.

Career patterns also vary by the type of institutional employment. Apparently the recruitment patterns and incentive structures of different types of institutions differ. This was most apparent in formal education and credential acquisition. For example, correctional leaders usually obtain special purpose credentials; but they have fewer credentials than any other group and the second lowest number of educational degrees. State department leaders obtain more special purpose and fewer general purpose credentials than any other group. They also have fewer degrees than any other group. Junior college leaders, the largest institutional subgroup, obtain more special purpose credentials than general purpose credentials and they represent the middle range in number of degrees. High school leaders, on the other hand, obtain fewer special purpose and more general purpose credentials than any other group and they have the second highest ranking in number of degrees. Every county leader in the sample has the distinction of at least a bachelor degree. They also tend to obtain more general purpose credentials than special purpose credentials.

In the course of the research, it was also discovered that the number of credentials increases as the level of educational attainment increases (with the exception of those who hold doctorates) and increases as years of work experience increases (up to 15 years), but decreases by age.

It is also apparent that the types of credentials (general purpose vs special purpose) are related to the level of educational attainment and years of work experience. In general, the level of formal education is directly related to the number of general purpose credentials and inversely related to the number of special purpose credentials. Work experience is directly related to the number of general purpose credentials. In other words, education and work experience have opposing relationships in patterns of credential acquisition.

The study of organizational memberships among trade and technical leaders in California lends credence to the general observation and belief that vocational educators with "successful," upward mobile (orderly) career patterns give greater support to organizations (both professional and non-professional). For example, those who have advanced to leadership positions in trade and technical education have more memberships than teachers of trade and technical education. This holds true for the number of memberships per person in national organizations (2.6 vs. 1.0), state organizations (3.0 vs. 1.8), local organizations (4.3 vs. 3.6) as well as overall memberships (8.9 vs. 5.6). Not only do leaders belong to more organizations available to both teachers and administrators, but their number of memberships is also increased by the fact that they belong to other organizations specifically for administrators.

Among national organizations the leaders have large percentages of memberships in the AVA (48.6 percent), NEA (47.5 percent),

NCLA (33.9 percent) and the AIAA (24.13 percent). The most numerous memberships among state organizations are in the CIEA (70.3 percent), CTA (63.9 percent), CVA (25.9 percent) and the CJCA (18.5 percent). The most common type of memberships at the local level include professional fraternities (53.9 percent), service clubs (44.7 percent), educational and cultural groups (42.3 percent), church and religious organizations (40.6 percent), civic and political associations (34.6 percent), youth and children's clubs (26.9 percent) and military and veteran groups (26.6 percent).

As do trade and technical teachers, the leaders belong to more professional organizations than non-professional organizations at the state and national levels. Unlike teachers, the organizations with the largest number of memberships is a vocational (exclusive) organization such as the AVA or the CIEA rather than a general purpose (inclusive) organization such as the NEA or the CTA.

When the memberships of trade and technical leaders are categorized by low (less than five memberships), medium (from five to ten memberships) and high (ten or more memberships) and compared with other variables, the following characteristics are found:

> Leaders with trade and technical teaching backgrounds are inclined to join fewer organizations and leaders with industrial arts and other vocational backgrounds are inclined to join more organizations than the overall population.
>
> Correctional leaders are disposed to join fewer organizations and public school teachers (high school, junior college and adult school) and county leaders are inclined to join more organizations than the overall population.

Leaders who begin teaching with at least a bachelor degree and leaders who work for advanced degrees while teaching are more inclined to join organizations than leaders with less formal education and those who do not work for advanced degrees.

Leaders who acquire five or more credentials are inclined to join more organizations and those who acquire less than five credentials are inclined to join fewer organizations than the overall population.

Leaders with Protestant religious affiliations are inclined to join more organizations than all other religious groups including those who have no religious affiliation.

Leaders who earn $17,000 or more are more inclined to join organizations than those who earn less.

Leaders with large amounts of work experience (fifteen years or more) are less inclined to join organizations.

WORK ANALYSIS

The Work Analysis Forms, an instrument developed by the Ohio State Leadership Studies in the Bureau of Business Research, was used to provide a modified form of job analysis. The WAF is designed to identify various aspects of administrative performance by recording estimates of time that the subject spends in various kinds of work. Estimates of time spent in contacts with persons, in individual effort and devoted to major responsibilities are reported in the following tables.

The WAF was sent to all 286 respondents to the Basic Description Questionnaire. The data from the WAF were collected from 224 returns (79 percent).

HOW DO THEY DIVIDE THEIR TIME BETWEEN PERSONS AND INDIVIDUAL EFFORT?

HOW DO THEY SPEND THEIR TIME WITH PERSONS?

HOW DO THEY SPEND THEIR TIME IN INDIVIDUAL EFFORT?

WHAT PROPORTION OF TIME DO THEY DEVOTE TO MAJOR RESPONSIBILITIES?

SUMMARY

From the estimates provided on the WAF, leaders of trade and technical education in California spend more time in contacts with persons than in individual effort. Attending meetings and conferences, consulting with subordinates and consulting with "other persons" (neither subordinates, peers nor superiors) require the largest amounts of time spent in personal contact. Writing and examining reports, processing mail and observing and inspecting demand the most time spent in individual effort. The most time consuming major responsibilities are coordination and planning.

Although there is a general similarity in the profiles of subgroups within the overall population a number of differences stand out. For example, leaders in county offices divide the time they spend in contacts with persons and in individual effort with a 70-30 percentage division of labor, but the leaders in adult schools have close to a 50-50 split. Other institutional subgroupings fall between these two extremes.

Other institutional differences are reported in the Comprehensive Report. For example, State Department leaders have one of the most distinctive profiles. They spend much less time with superiors, peers and subordinates as the overall population but twice as much time with other persons. Their largest single category of individual time is devoted to observation, inspection and examination. Although they spend much more time in examining reports, they spend less time in writing reports.

County leaders, who spend more time than any other group in contacts with persons, also have a distinctive profile. Since they have no programs to manage they spend much less time with subordinates and superiors and more time with peers, other persons and outside groups. They invest smaller amounts of individual effort with reports and mail but much more effort in observation, inspection and examination of programs. Time spent in coordination and consultation are well above the average for major responsibilities.

Leaders who work in high school or unified districts have a profile similar to the overall profile. Time spent with superiors and peers is higher than the overall population, but they are spending less time with subordinates even though they have programs to supervise. This may be accounted for by a time press on their individual effort. They have a much higher mean score for writing reports.

The profile of junior college leaders is very similar to that of the overall population. Most of the mean scores do not vary more than a percentage point. This is partially accounted for by the fact that they are the largest subgroup in the population and tend to dominate any measure of central tendency. Leaders in the junior college district offices vary more from the overall population and this may be because they are further removed from instructional programs. However, a significantly higher proportion of their time spent with persons are in contacts with subordinates and with outside groups. Their only atypical score in individual time is in observation and inspection.

This is also reflected in their high coordination score for major responsibilities.

Adult school leaders, who report the lowest scores for time spent with persons, spend considerably less time in meetings and conferences and more than the average amount of time with subordinates and outside groups. Their most atypical scores for individual effort are a lower score for writing reports and a higher score for preparing charts and similar materials. Their major responsibilities emphasize personnel activities and scheduling and de-emphasize coordination.

The much larger amounts of time that correctional leaders spend in contacts with persons reflects the unusually large amounts of time they spend with subordinates and other persons (perhaps inmates). Observation and processing mail received atypically high scores for individual effort. The much higher mean scores for supervision of technical operations as a major responsibility undoubtedly reflects the peculiar character of the correctional facility. Coordination, which normally demands more time, received a low score from correctional leaders.

Those interested in the details of these institutional analyses and other analyses (e.g., by type of authority and span of responsibility) are referred to the Comprehensive Report.

MAJOR ISSUES

Fifteen major issues were identified for consideration by trade and technical leaders and incorporated in a questionnaire entitled the Major Issues Questionnaire. Suggestions for the resolution of these issues were solicited from thirty interviewees (randomly selected from the 286 respondents to the Basic Description Questionnaire). Ten suggestions for the solution of each major issue were offered to trade and technical leaders in California in the MIQ. The leaders were asked to rate the importance of each suggestion on a five point scale.

The data from the MIQ are based on 239 returns (84 percent). The overall mean scores on the following pages can be placed into a quintile division and characterized as follows:

Above 4.3562	Very high
4.1518 to 4.3537	High
4.0275 to 4.1472	Substantial
3.7244 to 4.0218	Weak
Below 3.7109	Poor

HOW CAN VOCATIONAL EDUCATION ACHIEVE THE STATUS AND PRESTIGE IT NEEDS TO PERFORM ITS PROPER ROLE?

Orient counselors to the values of vocational education for students.	4.5798
Establish positive attitudes toward work in prevocational education at the elementary and junior high levels.	4.2650
Offer parents information about the advantages of vocational education.	4.1907
Publicize advantages (financial rewards, style of life, etc.) of graduates with occupational training.	4.0847
Offer programs of vocational orientation for the total student body.	4.0420
Publicize successful vocational programs via radio and television.	4.0298
Promote visitation of vocational programs by parents and public.	3.9099
Participate in many community organizations as a professional vocational educator.	3.8305
Establish area councils to develop regional strategies to promote vocational education.	3.6913
Maintain speakers' bureau to disseminate information about vocational education.	3.3174

HOW CAN THE FEDERAL GOVERNMENT BE MORE EFFECTIVE IN VOCATIONAL EDUCATION?

4.5804	Increase flexibility of vocational programs to meet local needs.
4.4115	Maintain continuity of federal support.
4.2928	Allocate funds to the districts earlier in the year.
4.2342	Increase federal appropriations to the states.
3.9724	Combine all vocational legislation administered by the Office of Education into one act.
3.7249	Maintain continuous national study of vocational education.
3.7244	Maintain a National Advisory Committee on vocational education.
3.5628	Establish a Department of Education and Manpower Development at the Cabinet level.
3.1304	Transfer the responsibility for identifying manpower needs from the Department of Labor to the Department of Health, Education and Welfare.
2.8610	Provide federal funds to construct and operate residential vocational schools.

HOW CAN VOCATIONAL EDUCATION BE BROUGHT INTO THE MAINSTREAM OF EDUCATION?

Publicize vocational programs through all available media.	4.4035
Establish policy and commitment for vocational education through school boards.	4.3689
Keep vocational education in comprehensive schools.	4.1518
Maintain vocational information programs for parents.	4.1278
Promote interdisciplinary experimentation.	3.8664
Establish more team teaching combining both academic and vocational teachers.	3.8616
Establish workshops, seminars and staff meetings to attack the problem of isolation.	3.7373
Relax course requirements to provide opportunity for students to take a greater variety of vocational courses.	3.5227
Interchange academic and vocational instructional staffs between all areas wherever feasible.	3.2844
Require all teachers and administrators to take courses in a broad range of subjects.	3.2455

HOW CAN THE SHORTAGE OF QUALIFIED TEACHERS BE RESOLVED?

Promote in-service training to increase teacher competence.	4.3991
Emphasize vocational competence in recruitment.	4.2795
Increase salaries by equating a year of work experience with a year of teaching experience on the salary schedule.	4.2434
Emphasize ability to instruct in recruitment.	4.1410
Concentrate on teacher guidance during the early period of teaching to reduce teacher "drop outs."	4.1404
Create a clearinghouse for qualified available teachers.	4.1039
Maintain a statewide recruitment program.	3.7277
Initiate a survey for qualified potential teachers by occupational area.	3.5614
Establish advisory committees for the specific purpose of recruitment.	3.2500
Emphasize formal education in recruitment.	2.9735

HOW CAN THE RELATIONSHIPS BETWEEN VOCATIONAL AND ACADEMIC TEACHERS BE IMPROVED?

4.6087 Include vocational teachers in the counseling program.

4.2588 Offer workshops for teachers (both academic and vocational) and industrial leaders to improve the preparation of graduates for the world of work.

4.1703 Bring vocational and academic teachers together for the integration of course content.

4.1174 Encourage teachers to participate in vocational organizations to advance vocational education.

4.0565 Encourage teachers to publish and speak about vocational education.

4.0519 Encourage teachers to participate in professional organizations that cover all areas.

3.9258 Emphasize comprehensive education to unite vocational and academic faculties.

3.8546 Increase the social contacts of vocational teachers with academic teachers.

3.6856 Expose vocational teachers to problems of academic teachers.

3.5939 Bring the problems of vocational teachers to the attention of all colleagues.

HOW CAN THE RELATIONSHIPS BETWEEN VOCATIONAL AND ACADEMIC LEADERS BE IMPROVED?

Increase efforts at articulation between schools on different levels (e.g., high school and junior colleges).	4.4842
Program more instruction on an individual basis so that students can move quickly through familiar material.	4.4395
Establish pre-tests for advanced placement.	4.1697
Establish credit criteria for work experience.	4.0909
Provide opportunities to skip courses by examination.	4.0818
Intensify efforts to identify and evaluate knowledge acquired out of school.	3.7963
Recognize knowledge acquired out school as "delayed credit" to be awarded at the conclusion of the program of study.	3.7387
Devise methods of equating learning in occupational programs with academic programs.	3.7109
Establish organizational "machinery" in every district to study the problem of non-accredited learning.	3.3048
Enroll students "on probation" to prove their non-credit knowledge.	3.2233

HOW CAN WE PROVIDE CREDIT FOR STUDENT LEARNING REGARDLESS OF HOW OR WHERE IT IS ACHIEVED?

4.2091	Increase vocational staff to expand occupational offerings.
4.2080	Emphasize comprehensive schools.
4.1593	Place vocational education under the administration of vocational educators.
4.0352	Increase the emphasis on occupational skills with the underprivileged.
3.9301	Increase the emphasis on basic education with the underprivileged.
3.8805	Increase the participation of academic staff in areas related to vocational programs.
3.7911	Expand the base of related general education in vocational programs.
3.7911	Increase the emphasis on specific occupational skills in vocational programs.
2.6927	Place vocational education under the administration of comprehensive educators.
2.4152	Emphasize single-purpose vocational schools (e.g., area vocational schools, vocational high schools, etc.).

WHAT KINDS OF INSTITUTIONS SHOULD OFFER VOCATIONAL EDUCATION?

Bring academic, vocational and industrial leaders together to study the relationships of school to the world of work.	4.5238
Join with the counseling staff for the solution of mutual problems.	4.5109
Join with academic colleagues in the problem-solving processes of the whole school.	4.4000
Emphasize successful vocational programs in publicity.	4.3652
Promote understanding of the vocational educator's role.	4.3074
Increase the rank (and salaries) of vocational leaders.	4.1022
Emphasize national focus upon vocational education at every opportunity.	4.0265
Bring academic colleagues into the problem-solving processes of vocational education.	4.0177
Provide a greater number of leadership training programs.	3.8628
Emphasize sensitivity training in the in-service training of vocational educators.	3.5330

HOW CAN WE PROVIDE DIVERSITY AND COMPREHENSIVENESS IN VOCATIONAL EDUCATION?

4.5575	Develop curricula that relates to both immediate and long range employment.
4.2035	Utilize short special purpose courses.
4.1733	Emphasize comprehensive institutions.
4.0837	Utilize industrial experts to diversify faculty and curricula.
4.0702	Provide education for job clusters or families of occupations.
3.9736	Introduce team teaching combining vocational and academic teachers.
3.8673	Incorporate general education in vocational courses.
3.6457	Disperse vocational courses into industrial settings.
3.4455	Stress general practices over specific techniques.
2.9224	Emphasize area vocational schools.

HOW CAN WE IMPROVE VOCATIONAL GUIDANCE?

4.5284 Maintain follow-up studies of graduates and drop-outs.

4.5129 Maintain placement services for all graduates.

4.5021 Provide in-service training in vocational guidance for counselors.

4.2489 Initiate more dialogue with counseling staff.

4.1853 Utilize vocational teachers as part-time counselors.

4.1233 Make vocational counselors available to students in the classroom.

4.0396 Utilize an advisory system of vocational teachers for counselors.

4.0393 Provide more student contacts with tradesmen.

3.7793 Establish employment standards for vocational students to parallel the transfer standards for academic students.

3.7696 Introduce more vocational exploration in elementary schools.

HOW CAN WE BETTER RESPOND TO THE CHALLENGE OF THE NEW TECHNOLOGY?

Build direct liaison with key people in industry. 4.6410

Encourage teachers to work in industry to learn new developments. 4.5983

Utilize more modern equipment through loan, lease or industry-based programs. 4.4786

Provide in-service training for teachers to keep up to date in trade and technical competencies. 4.4764

Utilize advisory committees to update course content, identify new courses and evaluate equipment needs. 4.4573

Bring resource people from industry to assist in classroom instruction. 4.3562

Provide more work/study programs. 4.1888

Conduct industrial surveys to determine specific training needs. 4.1472

Restructure traditional subject areas into "families" of occupational skills. 4.0388

Work closely with the State Department of Employment to keep abreast of manpower needs. 3.9440

HOW CAN VOCATIONAL EDUCATION RESPOND TO POVERTY PROBLEMS?

Offer short special purpose courses.	4.4518
Publicize training opportunities through radio and television.	4.1422
Join community groups concerned with solving poverty problems.	4.1289
Emphasize work-study programs.	4.0841
Utilize mobile counseling units in poverty areas.	3.7260
Devote more curricula to basic education.	3.7067
Eliminate educational expenses for members of poverty groups.	3.4064
Teach in the native language of monolingual groups.	3.1455
Develop more skill centers.	3.0691
Emphasize traditional rather than special programs.	2.3946

HOW CAN WE IMPROVE CONTINUING OCCUPATIONAL EDUCATION?

Maintain direct liaison with industry to determine continuing occupational training needs.	4.6853
Keep continuing occupational programs up to date with advisory committees.	4.4416
Maintain direct liaison with industry to publicize continuing occupational courses.	4.4156
Conduct follow-up studies on graduates and drop-outs.	4.3537
Establish more short special purpose courses for continuing occupational education.	4.3319
Utilize the more flexible structures of extension education for continuing education.	4.0310
Conduct leadership workshops on the planning of change in continuing education.	4.0307
Conduct industrial surveys to identify modifications in the curricula of continuing occupational education.	3.9563
Provide 100 percent federal support for innovative programs in continuing education.	3.7822
Establish vocational guidance centers for vocational alumni.	3.5785

HOW CAN WE PREPARE CRAFTSMEN AND TECHNICIANS TO TEACH?

4.3581 Include observation-demonstration sessions with master (expert) teachers in training programs.

4.2844 Establish on-the-job programs to help new teachers.

4.2611 Emphasize lesson planning.

4.2478 Demand practice-demonstrations of <u>all</u> trainees.

4.2159 Emphasize teaching methodology (how to teach).

4.1867 Emphasize the learning process (how students learn).

4.0493 Offer core programs throughout the year.

3.9823 Disperse teacher education to more locations.

3.5223 Establish a board of examiners to evaluate the work experience of teachers and to make recommendations for needed up-grading.

3.1211 Provide different teacher training for high school, junior college and correctional teachers.

HOW SHOULD WE PROVIDE FOR THE IN-SERVICE TRAINING OF TRADE AND TECHNICAL TEACHERS?

Maintain teacher exposure to the latest developments in their subject area.	4.5536
Provide programs of in-service training through industry.	4.3877
Give salary credit for qualified work experience programs in industry.	4.3233
Emphasize instructional skills in in-service training.	4.2684
Provide programs on in-service training at the local level.	4.2632
Maintain dialogue between administration and administrators and other vocational leaders about in-service training needs.	4.1667
Maintain dialogue between teachers and administrators about in-service training needs.	4.0485
Release teachers for on-the-job in-service training.	4.0391
Insist that districts provide salary credit for vocational in-service training.	4.0218
Provide programs of in-service training through the Bureau of Industrial Education.	3.8202

SUMMARY

In general, the scores on the MIQ tend toward the high ("most helpful") end of the rating scale. This is understandable since the suggestions originated with leaders. Also, a forced ordering was not employed. However, there were discernable differences in the scores for every issue and more differences when the responses were analyzed with respect to the teaching background and type of institutional employment of the leaders.

Overall scores The status and prestige problem of trade and technical education can be effectively met, as the leaders view it, by working with counselors, parents and students and through publicity. Most important to them is orienting counselors to the values of vocational education for students. But more orientation in vocational education is also needed for all students and their parents (even at elementary and junior high school levels). The leaders also call for more publicity about the advantages of vocational programs and the nature of these programs.

The four most important suggestions concerning the role of the Federal Government involve increased flexibility and continuity of federal support, increased funds and an earlier allocation of funds.

To combat vocational education's isolation from other forms of education, the leaders call for more publicity through all available media to reach the general public, especially the parents. They also feel, however, that policy and commitment for vocational education

must come from the school boards and that vocational education must be kept in comprehensive institutions.

In-service training receives the highest score as a suggestion for building quality into the teaching staff. Next in importance are suggestions concerning the recruitment of teachers. For recruitment, they emphasize vocational competence over ability to instruct; but both are high scores. They also desire equating work experience with teaching experience on the salary schedules, more teacher guidance during the early period of teaching and a clearinghouse for qualified and available teachers.

The leaders believe that the relationship of trade and technical teachers with their colleagues can be improved by including vocational teachers in counseling programs, by bringing vocational and academic teachers together for workshops, by integrating course content and by participating in professional, general purpose organizations. However, they also want trade and technical teachers to participate in vocational organizations, to publish and to speak about vocational education.

The most highly rated suggestions for improving leader relationships recognize the need for bringing differing groups of people together for study, problem-solving or training. For example, they want to bring academic and vocational leaders together with industrial leaders; and they want to join with the counseling staff for the solution of mutual problems. They would also like to join academic leaders in the problem-solving processes of the whole school, but are much less

enthusiastic about bringing academic leaders into the problem-solving processes of vocational education. The leaders believe that the role of the vocational leader needs better understanding, higher rank and higher salaries. They feel that the national focus on vocational education should be emphasized at every opportunity.

The most popular suggestions for an increased recognition of student learning, regardless of how or where achieved, are increased efforts at articulation between schools, more instruction on an individual basis to allow for acceleration, examinations for advanced placement and for skipping courses and credit criteria for work experience.

To develop an institutional "character" which supports vocational education trade and technical leaders desire comprehensive institutions with an increased vocational staff, the administration of vocational education by vocational educators and an increased emphasis upon occupational skills for the underprivileged.

Trade and technical leaders feel that diversity and comprehensiveness can be built into vocational education by keeping educational institutions comprehensive, by developing curricula that relate to both immediate and long range employment objectives and by providing training for clusters of occupations on the one hand and short, special purpose courses on the other hand. They also call for the utilization of industrial experts to diversify faculty and curricula.

The suggestions for improving vocational guidance were strongly supported by trade and technical leaders. Follow-up studies and

placement services for graduates receive the highest scores. Counselors are singled out for more in-service training, for more dialogue with vocational educators and for their presence in the classroom. Vocational teachers are singled out for service as part-time counselors and as advisors to counselors. Students are singled out for more contacts with tradesmen.

Suggestions for meeting the challenge of the new technology emphasize the relationship of trade and technical education with industry. The leaders want to maintain a liaison with key persons in industry, conduct industrial surveys and coopt industrialists as members of advisory committees and as instructors. They also want teachers to keep up to date by working in industry and participating in in-service training. They feel that the programs of trade and technical education also call for more modern equipment and more work/study courses.

Suggestions for dealing with the evasive problem of relating vocational education to poverty groups call for more short, special purpose courses and more work/study programs. The leaders also favor suggestions to work with community groups and publicize training opportunities.

According to trade and technical leaders, we need to maintain a liaison with industry to promote training, work through advisory committees and conduct follow-up studies to improve continuing occupational education. Programs must be flexible and utilize short, special purpose courses. They also feel that leadership workshops are necessary to keep abreast of the changes in continuing education.

The general conception of what is required in pre-service teacher training, as specified by the leader scores, are observation-demonstration sessions with master teachers, training in lesson planning and teaching methodology and practice-demonstration sessions in instruction. The leaders also desire that teacher training programs be conducted throughout the year and programs to help new teachers be conducted on the job.

Judging by the scores, the leaders are asking industry and local districts to sponsor in-service teacher training. They want salary incentives for teachers to induce them to obtain both in-service training and work experience in industry. They also believe that teachers ought to be released for on-the-job training. Above all, they feel that teachers should be exposed to the latest developments in their subject areas as well as training to improve their instructional skills. To keep abreast of in-service training needs, however, there must be communication between administrators, vocational leaders and teachers.

Comparisons by teaching background and by type of institutional employment There are distinctive differences in the MIQ scores when they are analyzed by the teaching background and by the type of institutional employment of the leaders. In general, leaders with teaching backgrounds in general education and industrial arts differ more from the leaders with trade and technical backgrounds than leaders with backgrounds in other vocational subjects. In addition, when the general education and the industrial arts groups are significantly different from the trade and technical group, their scores are usually

lower. The leaders with teaching backgrounds in other vocational subjects are more similar to the trade and technical group. However, when they differ from the trade and technical group, their scores are usually higher.

Comparisons by the institutional employment of the leaders also reveal some distinctive differences. The preferences are evidently related to the needs and the problems of each type of institution and the pressures upon the leadership role in the institution. Although the correctional leaders stand out in the number and type of significantly different scores from the overall scores, each type of institutional leader has some distinguishing characteristics in his approach to major issues.

James, Rhett H.; Thomas, A. I.
Effective Trade and Industrial Programs for the Disadvantaged Persons with Special Needs.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - Dec68 16p.; Speeches Presented at the Annual Vocational Convention of American Vocational Association (62nd, Dallas, Tex., Dec. 8, 1968). NASSTIE General Meeting.

*SPEECHES; *DISADVANTAGED GROUPS; *INDIVIDUAL CHARACTERISTICS; DISADVANTAGED ENVIRONMENT; *VOCATIONAL EDUCATION; TRADE AND INDUSTRIAL EDUCATION; PROGRAM IMPROVEMENT
*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968

A.I. Thomas reviewed the characteristics of persons with special needs and suggests some general solutions. Some of the programs and approaches which have been set up to deal with the problem are outlined, and recommendations given. H. Rhett James discussed differential disadvantagement due to race and some national training efforts directed at the disadvantaged. (EM)

VIII. Recommendations and Conclusions

I. Introduction

Let me extend my sincere thanks for the opportunity to speak here at the general meeting of this association and with the initials NASSTIE, how could I refuse. Also I wish to thank Mr. J. L. Thomas, of the Texas Employment Commission, Mr. Graham of the Texas Education Agency and Mr. Robert N. Taylor of Collins Radio Company for their inputs to the research effort of this talk.

If I bring you one message tonight it is; the emergency of this task. Members of business, education, and government must solve the problems of the disadvantaged persons immediately if we are to have peace and tranquility. If this nation on the brink of a revolution must be saved. You haven't seen a riot on downtown Fifth Avenue or downtown Park Avenue, its always uptown Fifth Avenue and Park Avenue in Harlem. ORDINARILY Working citizens do not riot, thus maybe the answer is jobs. How can you become more effective at your task of providing vocational and technical training to disadvantaged persons with "special needs". The term "special needs" has been defined as applying to those persons experiencing racial discrimination and others with physical, mental, social, and economic handicaps.

Let us explore briefly certain aspects of persons with "special needs" and suggest possible solutions to the encountered problems.

II. Realizing the Problem Exists

One of the serious deficiencies that exist among middle class orientated individuals is the inability to understand or realize there are authentic problems inherent in the behavior of the culturally deprived or disadvantaged. As individuals, we are prone to use ourselves as criterions. We usually develop some strong convictions concerning what other individuals should have done with themselves or what they could do if they put forth the effort.

III. Recognition of Problems[1]

1. Educational Deficiency - A major and most obvious drawback in the search for employment is educational deficiency. A youth may even be a high school or college graduate and still lack the ability to read or comprehend basic English or handle figures competently. This is often frustrating and bewildering to the individuals themselves.

   A. Reasons

      1. Lack of parental encouragement and support.

      2. Attend schools with poorest facilities and are taught by teachers many of whom also have deprived backgrounds.

      3. Overcrowded classrooms and overburdened teaching staff.

      4. Enters school from culturally deprived environment.

      5. Schools are middle-class orientated and fail to consider children from culturally deprived areas - they enter school behind and fall further behind.

      6. Mobility of families.

2. Socio-economic factors - the most massive, the most universal, and the disadvantage factor shared by most is undoubtedly socio-economic. Maybe "poverty-stricken" is more applicable term for this discussion.

   A. Implications

      1. No personal experience in the world of comfort and well-being.

      2. Poor images of mother and father working in dead-end jobs or not working at all.

      3. For their own futures, they do not identify with any vision of personal success.

      4. Attitudes reflect their home surroundings.

      5. Effects of deprivation etched on their personalities.

      6. Have difficulty relating to a new alien culture.

      7. Goals are usually short-range rather than long-range (it is usually difficult for them to think of future career possibilities when there is desperation about the future).

      8. Feeling of hopelessness (experienced so many defeats that they feel that there is no use trying).

      9. Appeal for glamour jobs and the development of unrealistic occupational choices (no relevant experiences by which to learn about various occupations).

[1] J. L. Thomas, Staff Training On The Disadvantaged, Texas Employment Commission, Dallas, Texas (1968).

As a result of some or all of these problems, disadvantaged persons may be severely limited in their employability. The principal manifestations may include the following:

1. They may function below their potential due to deficiency in educational background, or because they do not know of the various employment opportunities to which they could aspire.

2. They may have such low self-esteem that it is difficult for them to see themselves as able to acquire or hold jobs for which they are otherwise capable.

3. They may be socially undeveloped, act impulsively, have difficulty getting along with co-workers and employers. They may not understand how to accept supervision, to develop and learn under it, or to tolerate any implied criticism. They may be irresponsible, and lacking in middle-class standards of reliability. They may not show up on time for interviews, may be late for work, or not show up at all for several days, for punctuality is often not expected or practiced in their home environments.

4. Some may be bitter and disillusioned, with hidden or obvious hostility. Others will have a sense of powerlessness in the face of overwhelming obstacles. Others will compensate with an over-agressive manner, but more will be inarticulate and withdrawn.

IV. What Can Be Done

Raising the aspirational level of a disadvantaged person who is entering the labor market may well be a long-term endeavor.

1. He must be shown that the world can be friendly and that people want to help him (refer to importance of being able to accept the fact that special problems de exist).

2. He must be made to realize that the climb upward is made one step at a time, and that every bit of work experience will add to his skill and knowledge.

3. He must be helped to understand that aptitude and other tests are only ways of finding a clue to his potential, and not for putting him on the spot, and that he cannot pass or fail.

4. It may take longer and be more difficult to establish rapport with the disadvantaged, but extra time and effort must be expended to accomplish this objective.

5. Warmth, empathy, and sincerity must be conveyed. Disadvantaged individuals are hypersensitive to insincerity and lack of interest, as these attitudes reflect the inferior self-image they often have.

6. Great patience will be required because of lack of responsiveness in some of the individuals, and possibly a very negative attitude, even mistrust of most people.

There are significant numbers of disadvantaged in all racial and ethnic groups.

V. How Serious Is The Problem?

According to the Secretary of Commerce approximately 7.4% or 650,000 non-whites are unemployed, while 15% of the total population, with the majority non-white can not read on a 4th grade level. Over 25% of all adults can't read above 6th grade level and 36% have not completed high school. The problem is widespread again not limited to race.[2] But, for a nation that prides itself on its affluence this is tragic.

VI. What Has Been Done?

1. STEP program (Solution to Employment Problems) created by NAM in 1964, serves as follows:
   a. Collects and distributes data and advice on methods used by various companies.
   b. Films and case studies are available.
   c. Representatives are available.
2. MIND (Method of Intellectual Development) was created by NAM in 1966, with objective of improving basic educational tools. MIND was created in Harlem and further developed at Corn Product Company in Summit, Illinois.
   a. Utilizes programmed instruction.
   b. Individual approval
   c. Relatively inexpensive.
   d. Examples (1). A 57 year old illiterate worker upgraded his level in arithmetic and word knowledge about three grades in only 79 hours of taped instruction. He moved up three job levels and $800.00 more per year. Average cost per worker is $400.00; $100.00 less than recruitment cost.
3. HRD at Laurens, South Carolina, the average I. Q. was lower than 75. U. S. Research and Development Corporation in a program called (HRD) Human Resource Development conducted a 10-week course. 72 students completed the course and 68 became employed. 21 of the students, former receipents of

[2]Fortune, January, 1968.

relief and $140,000 in new salaries was generated for the local economy.

Success at Laurens was based on attitudial training motivation is the essential factor. Poor motivation is often the most disturbing barrier of all for unskilled, inexperienced workers.

4. Buddy System

On-the-job training is being used by some firms. A one-to-one relationship is established with a skilled worker and have provided some good results.

5. Systems Approach

North Carolina Manpower Development Corporation has an integrated approach: Outreach training, transportation, housing and mobility in a systematic fashion. This approach uses information Science, Inc. computer services to match hard core applicant and job.

6. Area Approach

Rochester area with Xerox, Eastman Kodak, General Motors, General Dynamics, Burroughs, American Can, Singer, 3M and others pooled $100,000 to create "Rochester Jobs Inc." This coordinating agency draws jobs together with applicant, and trains foremen.

7. Two Detroit Negroes founded Career Development Center (CDC) with Henry Ford II help along with other industrialists. CDC has about $200,000 worth of donated special training equipment. A second center is now being opened.

8. Ex-Cons

Xerox Corp. of Rochester established classes with ex-convicts, 21 weeks in length to provide practical work experience, combined with remedial reading and arithmetic lessons.

9. McDounel Douglas Corp. In an 18 month period McDonnel Douglas of St. Louis has trained 5,633 in its private war on poverty, at the cost of 8 million dollars.

10. Ford Motor Company of Detroit established employment offices in the slums and hired 700 out of 1,000 applicants without the usual tests.

11. LTV of Dallas area trained 684 workers from the Rio Grande Valley at a cost of about $5,000 each.

12. NAB - a guiding force behind many of the jobs for disadvantaged persons has been The National Alliance of Business, which with government encouragement has pledged 100,000 jobs by July 1969 and 500,000 by July 1971.

VII. Minority Gains in Employment

Plans for Progress companies (441) have shown 37.2% overall minority employment increase since 1966.[3]

Over 10% of all employees in the PFP companies were of minority groups, 995,934 of the total 9,567,833. The growth in minority employment gain is twice the rate of all citizens. The biggest category has been in white-collar position;

1966	59,125	2.8%
1968	225,225	4.9%

VIII. Recommendations and Conclusions

According to W. P. Gullander, President of National Association of Manufacturers "The objective must be to apply the creative genius of industrial America to the successful conversion of the unemployable into self-respecting, self-sustaining, productive people who can participate fully in this age of affluence..."[4]

The intensity of the violence of the summers makes crystal clear that the time for experimentation is past. Everyone wants to do a study, then study of studies or maybe a pilot program. What is needed now, is national committment to an urgent, massive program. A committment from all sectors of society, similar to the committment to win World War II, and the Korean War.

George Gallup, reports in Outlook, October, 1968, that 58% of the nation oppose guaranteed minimum income, but 78% favor a guaranteed work plan.

[3]Plans For Progress Newsletter, number 51 (September, 1968, U.S. Government Printing Office)

[4]National Association of Manufacturers, The Answer is Jobs (New York: National Association of Manufacturers, 1968) p.1.

It would appear that industry is succeeding where the public schools have failed. This is a serious indictment on our current American school system. Our schools in the most part, train all students, as if they are going to enter college or some other institution for vocational training. This approach represents our old, traditional, unrealistic way of educating for today's needs. More technical and vocational high schools must be established if the educational system is to be revelent to the disadvantaged person.

As a clue to why the education system responds the way it does, might be the image created by the mass medias. Seemingly the press and especially television depicts the successful man as white collar worker. Where has the pride in being a craftsman gone? We must stress to our youth that there is respect and dignity in being able to work with one's hands in blue collar skilled positions.

The pay scale of the building trades, IN DALLAS for example, averages about $4.80 per hour for electricians, plumbers, pipefitters, carpenters, sheetmetal workers, bricklayers, structural ironworkers, painters, roofers, cement masons, plasters and glaziers.

The school system should establish a comprehensive evening school program to train and upgrade all adults.

Short courses (8, 10, 12 or 20 weeks) in factories, at night if necessary are also needed to retrain and upgrade employees.

In general business must adopt a greater social responsibility role. The remedy to the disadvantaged persons might be a chance to develop some type of skill, as well as the ability to read and write; plus effective counseling and housing assistance.

Finally, we businessmen must change our attitudes, job requirements and where possible job descriptions.

From top management down to the foreman and individual worker continual efforts should remove discrimination against minority groups. Evaluate each police record on its own merit distinguishing between arrests and convictions. Old or youth

police records should be disregarded.

A. R. Miller, President of Ford, states "Before we were testing cultural backgrounds and some tests screened out individuals who could have done a good job." What is so magical about a college degree or high school diploma? Recently, I heard of a city that required trash collectors to be a high school graduate - obviously this job requirement is too high.

We need to break the poverty cycle of many of our citizens by extending an opportunity to perform, not be tested. Where possible job descriptions should be broken into more easier elements, thus creating more jobs at lower skill levels. With major revisions in our traditional practices and attitudes, business can hire, train, motivate and upgrade the disadvantaged persons with special needs.

"In the end it must be clear to all of us that no group of citizens can be expected to support, nurture, and espouse with pride a society which denies them human dignity and the right and opportunity to advance.[5]

ADDRESS BY H. RHETT JAMES

DELIVERED TO THE AMERICAN VOCATION ASSOCIATION

DECEMBER 8, 1968 - Dallas, Texas

A TIME FOR ACTION

Americans are acutely aware that there are millions of people among us who do not share in the mounting benefits of our economy. As a consequence our communities are visited with discord, and violence threthens the fabric of our society.

Poverty occurs in many places and isen dured by people in many situations; but its occurrence is nonetheless highly concentrated among those with certain characteristics. The scars of discrimination, lack of education, and bro ken families show up clearly from almost any viewpoint. Here are some landmarks:

--One-fifth of our families and nearly one-fith of our total population are poor.
--Of the poor, 22 percent are nonwhite; and nearly one=half of all non-whites live in poverty.
--The heads of over 60 percent of all poor families have only grade school education.
--Even for those denied opportunity by discrimination, education significantly raises the chance to escape from poverty. Of all non-white families headed by a person with 8 years or less of schooling, 57 percent are poor. This percentage falls to 30 for high school graduates and to 18 percent for those with some college education.
--But education does not remove the effects of discrimination: when n on-whites are compared with whites at the same level of education, the non-whites are poor about twice as often.
--One-third of all poor families are headed by aperso n over 65, and almost one-half of families headed by such a person are poor.
--Of the poor, 54 percentl ive in cities, 16 percent on far ns, 30 percent as rural nonfarm residents.
--Over 40 percent of all farm families are poor. More than 80 percent of nonwhite farmers live in poverty.
--Less than half of the poor are in the South; yet a southerner's chance of being poor is roughly twice that of a person living in the rest of the country.
--One quarter of poor families are headed by a woman; but nearly one-half of all family and its headed by a woman are poor.
--When a family and its head have several characteristics frequently associated with poverty, the chances of being poor are particularly high: a family headed by a young woman who is non-white and has less than an eighth grade education is poor in 94 out of 100 cases. Even if she is white, the chances are 85 out of 100 that she and her children will be poor.

The Changing Extent Of Poverty

There were 47 million families in the United States in 1962. Fully 9.3 million,

or one-fifth of these families--comprising more than 30 million persons--had total money incomes below $3,000. Over 11 million of these family members were childre, one-sixth of our youth. More than 1.1 million families are now raising 4 or more children on such an income. Moreover, 5.4 million families, containing more than 17 million persons, had total incomes below $2,000. More than a million children were being raised in very large families (6 or more children) with incomes of less than $2,000.

Serious poverty also exists among persons living alone are living in non-family units such as boarding houses. In 1962, 45 percent of such "unrelated individuals" 5 million persons--had incomes below $1,500, and 29 percent--or more than 3 million persons--had income below $1,000. Thus, by the measures used here, 33 to 35 million Americans were living at or below the boundaries of poverty in 1962--nearly one-fifth of our Nation.

In the decade 1947-56, when incomes were growing relatively rapidly, and unemployment was generally low, the number of poor families (with incomes below $3,000 in terms of 1962 prices) declined from 11.9 million to 9.9 million, or from 32 percent to 23 percent of all families. But in the period from 1957 through 1962, when total growth was slower and unemployment substantially higher, the number of families living in poverty fell less rapidly, to 9.3 million, or 20 percent of all families.

The progress made since World War II has not involved any major change in the distribution of incomes. The one-fifth of families with the highest income received an estimated 43 percent of total income in 1947 and 42 percent in 1962. The one-fifth of families with the lowest incomes received 5 percent of the total in 1947 and 5 percent in 1963.

Even if poverty should hereafter decline at the relatively more rapid rate of the 1947-56 period, there would still be 10 percent of the Nation's families in poverty in 1980. And, if the decline in poverty proceeded at the slower rate achieved from 1957 on, 13 percent of our families would still have income under $3,000 in 1980. We cannot leave the further wearing away of poverty solely to the general progress of the economy. A faster reduction of poverty will require that the lowest fifth of our families be able to earn a larger share of national output.

Private social endeavors appear woefully inadequate and government programs are still envolved in scratching the surface in getting to the core of the problem.

Now is the time, not for bewailing our difficulties, but for thinking them through and now is the time, not for despair, but for action.

What american needs is more committed leadership, dedicated to solving these mounting problems. America is a land of good intentions and most Americans, I feel, want desperately to help. But in the absence of sensible leadership, many will consider themselves powerless in the face of the masive problems that confront us and some, out of sheer frustration, will give way to oversilplified solutions that can only intensify rather than alleviate the tensions that reside in our communities.

The unrealistic structures of public education, that of preparing students to be drop-outs in society, rather than to become productive contributors, because of the over emphasis on academic education, only adds more oil on the fire.

The sterotype placed on vocational education in most American communities, has robbed thousands of American students of a good life and has placed them in a position of non-employables in todays industry because their education does not meet industrial needs. The absence of skills, the American Negro in particular, has suffered tremendous handicapps in this area. Yet this is not a problem facing the Negro alone. It is an all inclusive problem which the Negro, as in most instances, being on the bottom of the todem poll, is stripped of the requirements for becoming a productive citizen in this industrial age.

The Negro for example has been told so long that white is right, brown sticks around and black gets back, that often when the opportunities are there, he is not convinced they are available.....He has to be unbrainwashed and re-brainwashed in believing that its not a balloon's color that determines how high it flies, its what's inside it.

A society which has created structures for dependence, cannot endure. Men must be provided opportunities to be self reliant. A man, white or black will never be free until he stops begging, and becomes a producer. This is the challenge before us, turning our liabilities into assets...

In order to accomplish this great challenge we will have to incorporate two main ingredients...goodwill and reason .....In the long run a way out of our dilemmas will be found, not by marhcing and shouting, but by a calm and rational deliberation of men and women of goodwill and reason, gathered to match needs with resources and to organize for purposeful action.

What is required is concereted action by all sectors of society, government, business, education, voluntary agencies, professional people..... The emphasis is on the word concerted.....

Business and industry, the most realistic elements of our society, are our last hope.

Neither history nor modern experience, however, indicates that the sterotype or the present lack of qualifications of millions of Negroes, reflects the ability to perform on productive jobs. At the end of the War between the states, for example 100,00 of the 120,000 skilled workers in the South were Negroes. During world war II, employers who ere facing desperate manpower shortages found that minority group members who ere unaccustomed to eigher urban living or industrial environment could be placed quickly on production lines. In the 1960's a number of companies, working through programs such as Plans for Progress, again discovered that Negroes, when given the opportunity, can produce as well as any other group.

Our Nation can no longer afford quite expermentation and token hiring of the hard core. Unemployment in the ghetto, which for Negro youth alone equals the National employment rate, during the depression, is costly to the United States, to business, and to the cities which nurture business and give it its vitality.

The cost of employment discrimination, and the hard-core poverty it has produced, is a demonstrably heavy burden. The toll in the waste of human talent along, bleak, unporductive lives, broken homes, fatherless children, is exhorbitant.

Added to this is the cost of billions lost in income, and spent on welfare, and unharvested in taxes. President Johnson said in 1967 "If the Negroes today had the same skills as other Americans, and if they were free from discrimination in employment, our gross national product could become 30 billion dollars higher!"

Programs such as the National Alliance of Businessmen, the Opportunities Industrialization Centers, Southwest Industrial Training Corporation and other groups recognize the special needs for motivating the unemployed, are reaching down to relieve the situation.

Let us turn a moment to another great challenge facing us today... Why shouldn't black firms generate capital, provide jobs and help develop their communities? True, there are many in the ghettos who will need job training and many who in fact need jobs. Property denotes owership, and control, and its axiomatic that ownership confers dignity, parcitipation and freedom. Property and freedom are inserpable.....The people who yell--"Burn Baby Burn" have not investments nothing to loose. Business and property ownership is one of the major challenges facing the Negro in America today. In order to achieve this, there must be three areas of assistance,.....1. Management development; technical and administrative assistance and economic aid.....The loan of white corporate executive personnel to black business, or a community pool of corporate specialist can provide these areas of need. There must also be the development of risk-capital to help create, new business which black can participate in the ownerwhip....Sub-contracting or spinning off functions of the present corporation may be a Way to initiate these new businesses.

Most minority people understand fully that dignity, indentity, hope, human growth and personal achievement are qualities that cannot be achieved through welfare.... They can be achieved through full participation in the enterprise of American,.... Industry.....with its teeming abilities, can create wealth, promote a climate condusive to producers of wealth, build new markets, and in so doing provide opportunities for unlimited human developments for all people.....

Dallas with its teaming industrial complexes.....A city of emerging opportunities works for the furtherance of these goals, through consistent challenge and the presentation of need. It is our goal to make our community a pilot prototype of what can be done with the cooperative efforts of the Business, Civic and minority sectors. Dallas has demonstrated that it has the capacity for this growth and its leadership is commited to the continued development and furtherance of the aims of industrial, opportunities for the vocational trained and skilled citizens. Our goal is to make this opportunity manifest itself into all sectors of need. Yet the challenge lies within the providing of pre-vocational training. Those who have been locked out of opportunities for educational achievements, must have this phase of training to move into the industrial community as contributing employees. Such programs, again working with the DCCAC as O. I. C., a delegate agency commited to training the under-employed, the unemployed, the undermotivated.....O. I. C. has trained and placed over 400 on jobs in one (1) year---adding 1-1/2 million to our income with 1,000 people --- 4 million will be added.....Such programs as the National Alliance of Businessmen will enhance this opportunity to an inmeasurable degree.

Accoring to the latest Labor Department report of November 11, 1968, the unemployment rate of white workers in America remained unchanged in October, while the non-white jobless rate rose to 7.4 percent in September and 6.2 in August. Here lies our challenge. One to keep this percentage from rising, and to decrease it by excellerating the opportunities for persons in these catagories to receive pre-vocational training, skill training and job opportunities.

The American Vocational Association has, likewise, a great responsibility in this joint effort. Primarily, the furtherance of the importance of Public Schools providing educational opportunities to match the needs of industry; through realistic vocational counseling of students, making sure that their desires can match their abilities and realistic opportunities and the upgrading of the image of vocation al education in the minds of the American Citizen.

Too long, in many communities, Vocational educational suffered from the image of providing education for those who can't make it in the academic fields or those who cannot pursue a college education. This is not so. The requirements for Vocational Skills are just as severe as those in other areas of educational pursuits. Its a matter of vocational choice. Here the National Association of State Supervisors of Trade and Industrial Education Personnel can made an impressive contribution..... That of waging a major attack on systems who refuse to take a realistic position on the position of Vocational and Industrial Education must play in our industrial age..... Through constant prodding, inovations in Curriculum dewelopment and through public education, this media must tell its story of the necessity of Public Schools equipping its students for the needs of the Industrial society of which we are a part. The norman one-third of students who are either drop-outs, will finish High School but will not go on to college must have the skills for making a contribution to a productive society....if we do not meet this challenge, we shall continue to produce from one third to a half of our students who become thoroughly incapable of entering the industrial work world.

Violence is not the answer to this problem....We must rebuild, not destroy. We must give our support to groups and indiviauals who are dedicated to the restoring of sanity to our society.....We must redouble our efforts to assure that all our people and not some of them not only feel that they have a stake in order and stability and that our democracy does in fact afford the equality of opportunity we bost for it..... "This is our First Last Chance."

*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968; VOCATIONAL EDUCATION ACT OF 1968

The Vocational Education Act of 1968, the most comprehensive and far reaching piece of vocational education legislation in the history of this nation, is a tribute to the years of work and the wisdom back of it. Another bill which is now pending, the Educational Technology Act, provides that the existing technology program be strengthened and expanded as rapidly as schools can assimilate materials and equipment and provide professional staff to administer and oversee these programs. It also calls for the planning for and funding of model school systems which utilize technological approaches and technology in their educational design. This latter approach requires the redesign of cooperating model school districts and the provision of operational funds which are in excess of those normally provided. Educational technology offers the "key" for major breakthroughs in achieving instructional excellence. (CH)

TOMORROW, TODAY.

Excerpts from remarks by U.S. Senator Ralph Yarborough at 62nd Annual National Convention of ~~the~~ American Vocational Association, Hotel Adolphus, Dallas, Tex~~as~~, ~~Monday~~ December 9, 1968; 8:00 P.M.

President Shilt, distinguished officers, Fellow Workers for Educational Progress, Fellow Americans:

Welcome to Texas! As this 62nd Annual National Vocational Convention convenes, we in Texas are proud to be your hosts, and I am grateful for the privilege of representing my home State in this welcome to one of the most important educational organizations in the whold world. You do more than build America, your educational leadership in vocational fields is sought for in the undeveloped countries, and is needed to the uttermost ends of the earth.

This is a large and an important convention. We welcome you to one of the ten largest cities in America, to a state of considerable size. Recently at another convention, a speaker from another state turned to me and said, "Well, Texas is no longer the largest state in the Union, what are you going to brag about now?" I said: "We have substituted excellence for size."

During the next few days, I am going to meet and talk with many of you personally. I look forward to that, and to participating on two

of your panel discussions. But what I look forward to more than anything during this exciting week is the opportunity to introduce Senator Wayne Morse - the man who guided the new Vocational Education Act through Congress this year. And I pay tribute also to the great work of the Advisory Council on Vocational Education of 1968: and its report under the title:/"The Bridge Between Man and His Work". But most of all, I pay tribute to this organization.

The Vocational Education Act of 1968, the most comprehensive and far-reaching piece of vocational education legislation in the history of this nation, is a tribute to the years of work and the wisdom back of it, with which you urged this legislation. You did it, so that all persons of all ages in all communities of the nation could have an opportunity to build a better life for themselves, regardless of the age of their commencement.

This bill authorizes the Congress to appropriate($ 3 billion) three billion dollars, spread over the next four years.

Under the leadership of both John F. Kennedy and Lyndon Johnson, America has developed a committment to come to the aid of those citizens who lack the skills to compete for jobs in our increasingly complex Society.

A primary Must of this committment was written into the Vocational Education Act of 1963. Through this important legislation both young people and adults have gained the ability to become fully productive citizens.

In 1964, the year the Vocational Education Act of 1963 took effect, only some 4½ million Americans were enrolled in Vocational Education Classes. Because of the national government's concern, we have almost doubled the number of students enrolled in programs of vocational education. In 1968, there were over 8,000,000 enrolled in such programs, and the number is increasing rapidly.

This National committment has been espeically meaningful to Texans. In 1967 more than 563,000 Texans, over half a million, were enrolled in Vocational Education programs.

With all that involvement in vocational education in Texas, Vocational Education has found a home here.

I will not discuss the various titles of the Vocational Education Act of 1968; you have Senator Morse and other speakers to do that, and I will discuss my $110,000,000.00 Homemakers Amendment and my New Careers provisions in other sessions with you.

Instead I will turn to another bill, now pending, which I will re-introduce in January.

During the closing days of the 90th Congress, I introduced a bill -- S. 4184, The Educational Technology Act. I would like to tell you a little about it, and about the promise I think it holds for vocational education in America.

By almost any measure, the 20th Century has been a time of dynamic technological change.

For example, during the past two-thirds of a century, we have witnessed a 200-fold increase in the speed at which man can travel. It was a long leap from the model A to the more than 17,500 miles per hour that man can now travel. Those of us whose intellectual nourishment included a diet of Sunday comics "knew" that only Buck Rogers and Flash Gordon took seriously the possibility of interplanetary space travel. What we may not recall today, however, is that Buck Rogers was supposed to be operating in the 25th Century.

Technological change has intimately and oftentimes imperceptibly affected each of our

lives. Advances in such fields as medicine, psychology, and chemistry, to name a few, have been so striking as to defy the comprehension of the average layman. Even a year ago, few would have believed it possible that a person's heart could actually be successfully transplanted.

Breakthrough since 1900 such as radio, television, and the Telstar staellite have revolutionized man's ability to communicate. Many persons in this room today have been participating architects in the communications revolution.

Because of these changes, this is the most exciting age the world has ever known. It is also the most challenging.

And the velocity of change will increase.

For acceleration begets acceleration.

It is now anticipated that within 9 years, three-fourths of all persons working in industry will be directly or indirectly producing products that have not yet been invented.

At the vortex of change is the individual. For this new kind of world demands a new kind of a person.

It will require of all persons not only more knowledge, but a flexibility of viewpoints, since it is increasingly apparent that rigidity may be a greater barrier to progress than ignorance.

Stated in its most simple terms, the task of education has become that of providing more knowledge in less time to more people.

In the hands of imaginative teachers and

administrators, educational technology can inculcate in every student the sense of excitement, not the fear of change. It can help each child sniff the exhilaration of personal achievement, not snuff it out. It can help them embrace the world as it is, not reject it.

The object of the bill is to provide for the progressive improvement of the education process through the most effective utilization of educational technology.

The Educational Technology Act of 1968 is designed to meet all of the requirements for the successful introduction of technology into education. Most important, it is geared toward the bringing about of significant improvements in the educational process.

The intent of the bill is to provide a comprehensive program of funds for the improvement of education through the expanded use of educational technology in the schools and colleges of America.

The bill represents a comprehensive approach since, while it is readily apparent that educational materials, such as instructional films, would be useless without accompanying equipment, it is not so readily apparent that professional media personnel, area centers, and operational funds are required to realize the potential of communications media.

Essentially, the bill follows a dual approach. First, it provides that the existing technology program be strengthened and expanded as rapidly as

schools can assimilate materials and equipment and provide professional staff to administer and oversee these programs.

Secondly, it calls for the planning for and funding of model school systems which utilize technological approaches and technology in their educational design. This latter approach requires the redesign of cooperating model school districts and the provision of operational funds which are in excess of those normally provided.

The time for extensive use of all forms of educational technology within every single classroom of this Nation has already come. We now owe it to the children of America to prepare for it and to wisely use these newly developing educational

"tools" for the greatest number of young persons.

We all know that instructional technology is not a simple concept. We know that it is not simply more movies for more kids in their self-contained, 19th century classrooms. Educational technology offers the "keys" for major breakthroughs in achieving instructional excellence. It may even bring about basic changes in our traditional concepts of a school, since increasingly we are being made aware of the fact that students learn outside of school as well as--and perhaps as much as--in school.

It strikes me that if there is any one field in American education today which could

successfully take hold of something like the Educational Technology Act and run with it, it is you men and women here tonight.

If the war in Viet Nam were to end tonight and at the same time the Gods were to smile on all of us assembled here so that tomorrow morning we had unlimited funds to be spent for educational technology, I suggest we would not be much better off than we are right now. The reason, of course, is manpower: There are not enough men and women today who trained as educational technology specialists, who are trained in the art of producing films and film strips in concert with a teacher and a curriculum specialist; there are not enough

people trained to design and set-up educational technology systems.

Well, vocational education can train that manpower. And when it does, it should be done with educational technology; there is nothing more useless than teaching a teacher or a specialist about something they are to specialize in, rather than with the thing they are going to specialize in.

The promise of educational technology is almost overwhelming in the field of vocational education. Behond the obvious advantages of assisting in individualizing instruction and creating an atmosphere in which a child seeks to learn, educational technology in vocational education could be used for providing adequate drill

and practice in fundamental skill areas such as machine set-up procedures and operation, adjustment and maintenance of tools and equipment.

*Programmed learning materials could be used to assist students in proceeding at their own pace in learning the names of tools or of symbols used in drawings and blueprints.

*Through educational technology simulation of experiences with highly expensive machines could be provided.

*Through the use of computer games, instruction in management of farms, homes and businesses could take place, not to mention the use of computers in vocational guidance and career selection.

*Perhaps the most dramatic use of educational technology in vocational education to date has been

the experience of the Armed Forces. The application was wide-spread, and although dated by the sophistication of today's equipment and today's knowledge about how youngsters learn--the results were dramatic.

The list could go on and on. But I look to your imagination and expertise for such a list and for other suggestions. I plan to send a copy of the Educational Technology Act to each of your for your comments. And I look forward to your responses.

Educational technology is the education of tomorrow--the world of Buck Rogers and Captain Video. But Vocational education has the promise, the drive, and the imagination to make that tomorrow happen today. Thank you and God Bless You.

Implications, Priorities and Program Potential of
the Exemplary Program Section of the Amendments

By John W. Letson

Prepared for
National Conference on Exemplary Programs and Projects

The contribution that vocational education has made to the growth, expansion and development of the nation is a thrilling story. It is a story worthy of telling and retelling and in general includes the listing of successful accomplishments that are the envy of the whole world. How it is now possible for a relatively small part of the work force to feed and clothe the nation, with surpluses to spare, is a part of our economic history that other nations would like to emulate. A large part of the credit for this accomplishment is due vocational education and the thousands of dedicated teachers and others who have made it the dynamic force that it has been and is.

It is this success story, however, which at least in part confronts us with the dilemmas we face today. The world of work is changing. Old jobs have disappeared and new ones are emerging. Work opportunities for the unskilled and untrained are disappearing while jobs calling for more education and higher skills are increasing at a rapid rate. A vocational education program designed to meet the needs of a past era is inadequate for the demanding present. Changes must be made to adapt the program to the changing world in which we live, and it is the implications, priorities and potential of this process to which this paper is addressed.

By including a section on Exemplary Programs and Projects in the 1968 amendments to the Vocational Act of 1963 the Congress recognized the need for increased effort to develop new approaches to the solution of educational problems. The Exemplary Programs section also gives evidence that the development and implementation of creative ideas can best be carried out by those who are actively engaged in the educational process. At least the Exemplary Projects section provides an opportunity to demonstrate that this is true. The funds authorized have not yet been appropriated, but it should be assumed that they will be, and no time should be lost in beginning the creative planning the Exemplary Projects section authorizes and will require.

The purposes of the section are well stated in the Act:

Findings and Purpose

Section 141 "The Congress finds that it is necessary to reduce the continuing high level of youth unemployment by

developing means for giving the same kind of attention as is now given to the college preparation needs of those young persons who go on to college to the job preparation needs of the two out of three young persons who end their education at or before completion of the secondary level, too many of whom face long and bitter months of job hunting or marginal work after leaving school. The purposes of this part, therefore, are to stimulate, through Federal financial support, new ways to create a bridge between school and earning a living for young people who are still in school, who have left school either by graduation or by dropping out, or who are in post-secondary programs of vocational preparation, and to promote cooperation between public education and manpower agencies."

Funding authorizations for the "Exemplary Programs and Projects" section may or may not bear a relationship to actual appropriations when made, but are an indication of the importance Congress has placed on this section:

$15 Million	June 30, 1969
$57.5 Million	June 30, 1970
$75 Million	June 30, 1971
$75 Million	June 30, 1972

Fifty percent of the funds appropriated under this section may be used by the U. S. Commissioner for grants or contracts with state boards or local educational agencies and other organizations, and fifty percent may be used by state boards for model vocational education programs under the state plan. Each state will receive a basic state allotment of $200,000 with the remainder allotted on the basis of population aged 15 through 19.

An important provision of the Exemplary Programs and Projects section is that financial assistance for a project may not continue for more than three years. At the expiration of three years the cost of successful projects could, of course, move to the regular and/or vocational budget, but careful planning is required if this is to be accomplished. Title III of the Elementary-Secondary Education Act contains a similar provision. Experience has shown that many school systems have found it difficult to continue innovative programs, regardless of how successful, after the expiration of the three year funding period. This is likely to be the case with the exemplary projects section of the Vocational Education Act unless projects which are approved provide for an orderly transition, at the expiration of three years, to other financing.

Innovation in education generally and vocational education in particular has been limited because of the absence of risk capital. The demand for dollars to support the on-going program has left little leeway for experimentation and innovation even though the experimentation may have ultimately paid dollar dividends. The exemplary programs and projects section of the new act provides a source of risk capital. Resources provided under this section should be considered as exactly that -- risk capital, and not confused with funds required to develop and operate programs on a long range basis. This suggests that cost-effectiveness must be a primary concern from the beginning. Both the design and approval of innovative projects should reflect a consideration of the unit cost of anticipated results. Even if an innovative program achieves its purpose, if the unit cost is too high, the project will ultimately be abandoned because of the competition for dollars which could buy a larger return if spent in a more efficient manner. This is merely another way of saying that innovation in education must be as concerned about the reduction of costs as is a private business firm in search of dollar profits. A private business offsets the cost of experimentation through the expectation of future profits. The same is true in education except that profits are realized through the improved performance of those who are a part of the educational effort. In both instances it is disastrous if "we pay too much for a whistle."

Section 143 of the new act outlines in rather specific detail the uses which may be made of funds appropriated under Part D -- Exemplary Programs and Projects.

Section 143. Grants or contracts pursuant to this part may be made, upon terms and conditions consistent with the provisions of this part, to pay all or part of the cost of --

(1) planning and developing exemplary programs or projects such as those described in paragraph (2), or

(2) establishing, operating or evaluating exemplary programs or projects designed to carry out the purposes set forth in Section 141 and to broaden occupational aspirations and opportunities for youths with special emphasis given to youths who have academic, socioeconomic, or other handicaps, which programs or projects may, among others, include--

(A) those designed to familiarize elementary and secondary school students with the

broad range of occupations for which special skills are required and the requisites for careers in such occupations;

(B) programs or projects for students providing educational experiences through work during the school year or during the summer;

(C) programs or projects for intensive occupational guidance or counseling during the last years of school and for initial job placement;

(D) programs or projects designed to broaden or improve vocational education curriculums;

(E) exchanges of personnel between schools and other agencies, institutions, or organizations participating in activities to achieve the purposes of this part, including manpower agencies and industry;

(F) programs or projects for young workers released from their jobs on a part-time basis for the purpose of increasing their educational attainment; and

(G) programs or projects at the secondary level to motivate and provide pre-professional preparation for potential teachers for vocational education.

For the first time since vocational education was initiated following the passage of the Smith-Hughes Act in 1917, there is a free and unincumbered opportunity to design and implement innovative and creative programs which give promise of moving vocational education forward toward a higher and more effective level of accomplishment. There is now a chance for vocational education to demonstrate that it can do for the urban poor what it did for many of the rural poor in years past. Also, there is now an opportunity to move vocational education into the mainstream of educational effort and eliminate the artificial separation that has characterized general and vocational programs in the past. Whether education, vocational and general, is equipped and ready to meet these challenges only time will tell. The urgency of doing so, however, cannot be overstated, and on the outcome will depend the future of thousands of potentially able workers and in the final analysis the future of Georgia and the nation. It is time to be up and about the task at hand.

It is recognized that the following comments reflect a personal bias, and for some school systems the suggestions may be far from innovative. Innovations, like other developments, are related to time and place and what is innovative for one school or one community may be past history for another. At the very least, vocational education now has an opportunity and a charge initiated by Congress to find the new and innovative programs which will more adequately prepare young people for the changing world of work.

Work Experience

Many of the things learned by an older generation in the process of growing to maturity are no longer a part of the experience of young people growing up today. The difficulties many youths encounter in meeting today's job requirements are related to the absence of work experience that was routine for past generations. Dr. George Counts commented recently that some of our problems today are related to the fact that young people no longer experience the discipline of the milk cow. It was not possible to put off the milking of a cow until next week because of bad weather, nor was it possible to skip a milking session because of other attractive possibilities for utilizing the same amount of time. The milk cow was a demanding task master and for many young people contributed to and helped develop a sense of responsibility which carried over into job performance in later years. Dr. Counts was not suggesting that we try to provide each family with a milk cow. The growing use of reconstituted milk may result in the remaining cows becoming obsolete anyway. Dr. Counts was suggesting that we need to find some modern substitute for the discipline the milk cow provided. Meaningful work experience for high school pupils is a hopeful answer.

Vocational education pioneered the work-study idea and is now providing excellent work opportunities for a limited number of young people. The challenge before us is to expand existing cooperative programs to include most if not all young people as they move through the secondary schools. In an Atlanta school that offers three cooperative work-study programs it was found that more than three times as many additional pupils were working part time without benefit of the guidance and assistance vocational education could provide. The time has come to think in terms of the total challenge rather than the limited, institutionalized programs now operated as a part of vocational education. The work-study concept must be expanded to include more than training for a specific job. The value of work for its own sake, providing opportunities for real involvement and participation in worthwhile activities, could add meaning and validity to much that is now meaningless for some young people. Volunteer, contributed service in schools, hospitals and other health institutions, and community agencies of many kinds offer educational possibilities that are virtually untapped. All that is needed is a design and structure that can make the goal of work experience for all a

meaningful reality. The new Vocational Education Act may offer some possibilities in this direction.

Most vocational work-study programs follow a rather standard pattern -- morning classes at school followed by work in a business establishment in the afternoon. This type of schedule has worked well and is now working well for many pupils. This standard pattern, however, has not been fully successful for educationally disadvantaged, poorly motivated pupils. The following comments and questins may provide some leads as to how the work-study approach can be varied for increased effectiveness.

1. The trend toward institutionalizing cooperative work-study programs has been greatly influenced by inflexible high school scheduling. There is little justification today for the limitations imposed by the standard day of six periods. Further experimentation is needed to demonstrate that high schools, particularly in urban areas, can operate from early morning to late at night and better serve the needs of young people and adults. It should be possible for pupils to work in the morning and take academic classes in the afternoon or evening thus increasing tremendously the number of work opportunities available. It would then be possible for two students to fill one full time position which, in many instances, would prove advantageous for both pupils and cooperating business firms.

2. For some pupils work-study arrangements would be improved if it were possible for them to work full time for a period of weeks and alternate the work schedule with an equal number of weeks of full time school attendance. Such an arrangement would, of course, require some fundamental changes in the typical high school program. The increased flexibility achieved through such arrangements would pay dividends in ways other than improved work-study possibilities.

3. We have too often assumed that academic courses must be pursued within the four walls of a classroom and that pupils must be in physical attendance at a school in order to progress toward graduation. In some instances it might be better to send teachers to the business firms where pupils are employed rather than require the pupils to be present in school a part of each day. Such a plan suggests a number of innovative possibilities for developing programs which would best fit the needs of pupils -- especially those the schools are not reaching at present.

4. In spite of the changed world in which we live, public schools, for the most part, still adhere to a school calendar that was designed to fit an agricultural past. Each year we see thousands of young people apply for summer jobs and witness the frustration that results from the obvious fact that there are not enough summer work opportunities to go around. The time has come to organize our schools on a full year operating basis and take advantage of the increased flexibility to design programs that best fit the needs of all pupils enrolled.

5. The time has come for the schools to assume responsibility for all pupils until they successfully make the transition from school to work. For many, of course, the next step following high school will be further training -- college, technical school or participation in other kinds of advanced preparation programs. For a majority, however, the next step is a job. This will not be too difficult an assignment for able, well adjusted, properly motivated pupils. Unfortunately, all do not fall in these categories. There is an urgent need for innovative demonstrations designed to better prepare disadvantaged young people for that important next step -- a job. Many of these pupils become disenchanted with school long before they are eligible for most existing vocational programs. An earlier beginning with programs designed to utilize the techniques vocational education has pioneered, offers promise that many of these pupils can be salvaged. Vocational education can often provide the motivation that academic instruction alone has not provided.

Guidance and Counseling

The high school guidance and counseling program has been tremendously expanded in recent years but still reflects a pupil-counselor ratio that is too high. As related to vocational guidance, however, the major problem is not the high ratio. A part of the difficulty lies in the fact that vocational guidance has not been assumed as an essential part of the counselors' role. The exemplary projects section of the new Vocational Act recognizes the importance of improving vocational guidance programs. There is an obvious need and a broad opportunity provided through the act to devise innovative ways of achieving this goal. It would be a serious mistake to further separate general and vocational education by encouraging the development of vocational guidance as separate and

apart from the overall guidance function. The obvious need is for the counselors to become proficient in vocational guidance and to assign an equal priority to the needs of all pupils whether bound for college or an early job.

It also would be a mistake to assume that the improvement needed in the area of occupational understanding can be fully accomplished through improved counseling. The world of work is far removed from the experience of many young people today. Occupations that were usable and close at hand in years past are now remote and foreign to their experience. The average teenager today cannot describe with full understanding and accuracy the work that his father does. The remedy lies in a greater emphasis upon elementary and high school programs designed to achieve for all pupils a better understanding of the world of work. Occupational information is essential for wise occupational choices, but such understanding is not best achieved through the usual academic approach. Innovative programs and exemplary projects are needed to demonstrate how best to achieve the occupational understanding that is so essential if young people are to make wise choices.

Early Childhood Education

There is no question about the urgent necessity of discovering and implementing projects and programs which will be more effective in eliminating and preventing the disastrous effects of poverty and deprivation. In recent years there has been an intensive search for better answers to the educational problems so frequently related to the limited and impoverished pre-school experiences of many children. A growing body of evidence supports the position that the pre-school years provide the most hopeful point of attack. Many special programs are underway to demonstrate that properly designed pre-school activities and experiences can greatly improve a child's readiness for learning. Thus far these special pre-school efforts have been successful within limits, but in terms of the total need only a few children have benefited. For many reasons it is doubtful that an extension of the kindergarten-nursery school concept down to ever earlier years can provide the full answer.

In earlier years, vocational education (county agents, home demonstration agents, agriculture and home economics teachers) achieved dramatic results in reducing poverty and its disastrous effects throughout rural America. Although the need is as great or even greater than ever before in urban areas throughout the nation, vocational education has been slow to transfer resources and know-how to meeting the urban problem. At least a part of the answer to meeting the needs of pre-school children lies in improving home conditions and in involving the total family in the kinds of activities which vocational education has pioneered through the years. It is tragic for vocational education to have invented what has been referred to as a magic process and through default fail to adapt it to the special and somewhat different needs of the urban poor. Time is short, but it is not too late to undertake the home improvement efforts which will be most effective in solving many related urban problems.

Working Paper

Unifying an Entire System of Education Around a Career Development Theme

Edwin L. Herr
Professor of Education and Chairman,
Graduate Programs in Counselor Education

The Pennsylvania State University

Introduction

The premise upon which this paper is based, that an entire system of education can be unified around a career development theme, may seem pretentious, but it is neither premature nor is it an impossibility. Such an expectation is not premature because as the outcomes of education obtained by many young persons are appraised objectively the irrelevance and the lack of specific purpose which results can be readily documented. For example, one study published by the U. S. Office of Education (Grant, 1965) indicated that for every 10 pupils in the fifth grade in 1957-58, 9.4 entered the ninth grade in 1961-62; 8.1 entered the eleventh grade in 1963-64; 7.1 graduated from high school in 1965; 3.8 were expected to enter college in the fall of 1965; 1.9 would likely earn baccaleureate degrees in 1969. Thus, approximately 30 percent of American children leave education before high school graduation. These statistics include young persons with above average intelligence who have found no meaning in school; who recognize that it is not designed for them. But needs for career development are not restricted to those who drop out. There is reflected in these statistics another 50 percent of the student population who, at the conclusion of high school, enter the labor market directly and they, too, must come to terms with vocational choices and career considerations whether determined by purpose or by chance. Finally, if the college choice can be seen as something other than an end in itself, as an intermediate step in career development, then those who select this educational option also need help in facilitating their career development. Studies which examine whether career development and choice-making are really of concern to students in elementary and secondary school demonstrate repeatedly that students assert their interest in these areas but also that they are not getting from education assistance in planning the steps which will lead them to their goals, to personal clarification, or to a sense of the vocational and social contexts with which they must cope (Slocum and Bowles, 1967; Campbell, 1968).

It is not the purpose here to exhaust the documentation which supports the relevance of career development for pre-adolescents or adolescents. Rather, it is to acknowledge that the central purposes of education--to prepare the young to accept the reality of constructive pathways to adulthood, to help them engage these pathways successfully, and to assist them find personal relevance in the life options available to them--are not being effectively accomplished for a large number of persons. Because of the personal and societal deficiencies which obtain as a result of this reality, fundamental realignments must occur within the totality of the educational enterprise if the elements by which it discharges its responsibilities are to be made meaningful to all students, not just certain homogeneous strata.

One of the goals, then, toward which education must direct itself in a specific fashion is the provision for every student to acquire the skills which will

allow him to make a livelihood; to be responsible economically for himself and for his future family; to be employable. Such skills are not confined to the manipulative skills--the ability to use some set of tools or knowledge to accomplish a specific task or function. While the attainment of such narrowly defined skills have validity in some isolated situations, the present dynamics of the occupational structure lend little credence to the generalized importance to education of such goals in responding to the future.

Rather, the skills necessary are those by which one can use his capabilities, whether limited or great, freely and responsibly in ego-involved activities which contribute both to individual fulfillment and to society's maintenance and progress. These types of skills precede and transcent task skills. They involve the personal values and attitudes which motivate one to gain task skills, to want to contribute, to be constructive. They are the foundation for goal-directed behavior which is vocationally effective. They involve knowledge not only of specific tasks but of the ways such tasks are combined interdependently in the occupational structure and in varied contexts as well as of the opportunities available by which one can use himself in shaping personal and social fulfillment. Such skills do not arise spontaneously, they must be developed in systematic ways.

Is a wedding of self-knowledge, knowledge of environmental options, the acquisition of requisite skills by which effective strategies of planning for, coping with, and mastering the diversity of opportunities which this society affords possible within the context of educational experience? The answer is a qualified Yes: qualified by the purpose and system which is applied as well as by a broadening of the lines by which education and the larger society relate.

In the past the goals of education have reflected a consciousness of the concerns expressed here. However, it has been assumed that all of the goals identified will result as by-products from general education. Little systematic attention has been given to the need to create experiences designed to foster the individual attitudes and skills which comprise such goals. In some instances, education has tried to meet the needs of individual groups within the society with emergency programs conceived in gross terms without responding to the variance, the heterogeneity, which is found in any group whether it be labeled disadvantaged, rural, pre-dropout, mentally retarded, specialty-oriented, or college bound. Further, education has often responded to the "whole child" by allowing the objectives of particular disciplines to define the boundaries within which educational experiences would be conceived, thus negating for the individual the possibilities for interrelating, articulating, sequencing, individualizing, differentiating, and intergrating the deluge of experiences which constitute growth, learning, and the attainment of personal competence.

The purpose of this paper is to examine the efficacy of using career development as an organizing theme around which education can be unified and by which the relevance of education can be restored to larger number of persons. To do this, the following will be considered.

1. Implications of a systems approach to education.

2. Career Development.

3. Behavioral Goals.

4. Relationships between career development and general education.

5. Relationships between career development and vocational education.

6. Operational goals towards which exemplary programs and projects might be directed.

Implications of a systems approach to education

Before turning to some of the implications of career development per se, it is necessary to examine some implications inherent in a systems approach to education. A systems approach to the solution of educational problems requires a restatement of ends and means concerns of educational philosophy in terms of the application of resources (means) to the attainment of system objectives (ends) (Phillips, 1966). With regard to career development as a unifying theme, the questions become: Can it be accomplished within existing institutional forms? How? If not, why? What modifications to existing structures are necessary? What is required to arrange the educational environment of individual consumers so that particular types of behavioral change can take place? What are the management problems for which solutions must be found? Within the context of education, any system conceived must respond to the separate as well as the interdependent effects of at least the following:

1. Learner Characteristics
2. Resource Characteristics
3. Teacher Caharcteristics
4. Instructional Methodology
5. Administrative Dimensions

The basic question which must be addressed is: "which resources or combination of resources (people, places, media) are appropriate for teaching what type of subject matter to what type of learner under what conditions (time, place, size of group and so on) to achieve what purposes" (Phillips, 1966). Implicit in this question are such realities as the different tempos by which learners can proceed through the system, the required translations of subject matter which will facilitate their progress, as well as a step-wise series of purposes or competencies to be achieved at different developmental points. Portions of knowledge and increasingly complex skill acquisition should be built one upon another according to the characteristics by which learner readiness is defined. It is necessary to define specifically and measurable the terms of competence students must demonstrate upon completion of a set of educational experiences. Abstract or global concepts are not sufficient for these purposes. They must be broken into their components in ways which diminish semantic affects and incremental goals so general as to be not susceptible to programming or measurement.

One of the thorniest problems of evaluation is the statement of expectations for students (Hull, 1967). It necessitates the making of value judgments of what the pupil ought to be able to achieve and it requires description of these activities in behavioral terms. If career development is to be individualized, then each student must be able to work on information or be exposed to experiences different from other students at any given time. This requires both an emphasis on diagnoses and on the availability of diverse learning experiences from which can flow prescriptions for individual progress. Thus, the individuality of pupils demands a set of expectations for each person because career choice, occupational interests, and other relevant variables are determined by each student's concept of occupations, is related closely to his concept of self, and is based to a great extent on his environmental development.

Programmed efforts to facilitate career development must begin at the student's level of development and proceed on the basis of personal variables defined by experiences, aspirations, values, capacities, and a continuously spiraling series of success experiences within the career developmental objectives established.

Programmed instruction, as a technology, has made a valuable contribution to a systems process by defining at the outset the desired behavioral change in the student, then breaking down material to effect this change into a logical series of minute steps which the student can take. Through provision of continuous reinforcement and encouragement, immediate recognition of each increment of knowledge is provided and the learner is continuously tested to determine qualitatively whether or not the specific behavioral changes have occurred. If the intended changes have not occurred, one of the most important elements in programmed instruction is implemented--the system is redesigned until the desired results are obtained. There is no intent here to foster the use of teaching machines per se but rather to emphasize the importance of the philosophy of programmed learning to a systematic approach to the facilitation of career development. Indeed, in a systems approach to implementing career development, education cannot afford saturation with just one technique at a time, becoming hung-up on sub-systems, but rather available media must be orchestrated in ways which respond effectively to learner characteristics. The observations of Bruner (1964) about curriculum construction are of prime concern to a systems approach facilitating career development. He indicates that a curriculum reflects not only the nature of knowledge itself but also the nature of the knower and the process of acquiring knowledge. It is an enterprise within which the line between subject matter and method grows necessarily indistinct.

Goodlad (1964), Guba (1965) and Krathwohl (1965) have variously identified other factors which must be incorporated into curricular design and by analogy a systems approach to education. Among them are the needs for an explicit theoretical or logical framework; analysis of objectives at increasing levels of specificity, including broad and general statements necessary to program development, goals of sequences of lesson plans and of single lesson plans; curriculum sequences which move from the bottom up, the elementary school forward; the development and testing of materials with children and youth representing divergent cultural groups; the testing of advantages and disadvantages of various learning styles; and, the implications of each of these for new styles of preparing teachers and counselors to implement and facilitate such systematic efforts to individualize development.

Career development offers the content and the objectives within which such a system can be conceived. The following section will provide an overview of career development and, then, respectively a concept of behavioral goals which might be evolved from career development.

Career Development

Work has always had the potential of meeting more than the economic needs of man. It also provides a means of meeting far broader social and psychological needs among which are needs for social interaction, personal dignity, identification and human relationships. In view of the prevalence of alienation, characterized by difficulties in seeing oneself surely and constructively as a part of the adult society, it seems apparent that many individuals have not been assisted to view work as having personal relevence, as being critical to the way of life they will exhibit, or as being a consistent vehicle for finding self-fulfillment.

The recent surge of findings and theoretical speculation from occupational sociology, developmental psychology, vocational psychology, decision theory and information theory have cast into increasingly bold relief the factors which facilitate or impede individual aspirations and plans of action which lead to placement in the labor market and to development of vocational identity. While career development theory is not yet addressed as completely or precisely to women or to the disadvantaged segment of society as is necessary, that which is presently known provides a sufficient context for programmatic approaches designed to spur the development of effective vocational behavior. The present state of career development is largely descriptive of what happens if no purposeful intervention is convened in the school or in the community to facilitate the process. Thus a systematic approach to such intervention will not only profit the individuals so exposed but will broaden the empirical base from which increasingly meaningful theory can flow.

Brayfield (Brayfield and Crites, 1964) has pointed out that the term theory as applied to vocational development is somewhat pretentious if used in the strictest sense. But, if one views the dominant approaches to career development with some objectivity, it is clear that even though no current approach yields the comprehensiveness of explanation desired, in a collective sense there exists a conceptual frame of reference which provides a set of constructs and propositions which serve to explain differential vocational behavior and decision-making as well to facilitate such developmental processes.

The approaches which describe career development or some piece of it can be classified in several ways. They have been classified by Hilton (1962) into the Attribute Matching Model, the Need Reduction Model, the Economic Men Model, the Social Men Model and the Complex Information Processing Model. Osipow (1968) has placed career-development theory into four categories: Trait-factor approaches, sociology and career choice, self-concept theory, and vocational choice and personality theories. The following discussion of career development will present a blend of these two approaches as they relate to a taxonomic structure of career development.

The most consistent approach to career development, at least in a historical sense, is that labeled trait and factor. The trait and factor approach to career development, because of its consistent partnership with the findings of psychometrics, has identified the importance of certain specific factors to choice behavior, job satisfaction, and job success. It has examined and identified the interaction of variables such as occupational aspirations, occupational stereotype and occupational prestige as they influence personal value systems and by which is delimited the occupational fields in which exploration will be focused; the importance of social status, socio-economic background, parental influences and the existence or lack of existence of role models in creating the climate in which vocational development proceeds; the occupational limits prescribed by intelligence level and by the possession of specific aptitudes. It has demonstrated that most individuals have multipotentiality and, thus, the cliché that there is one right job for everyone has little foundation in reality. In addition, trait and factor approaches cast light on the range of ability and temperament found in and the latitude which is available to tolerate individual differences in most occupations.

Trait and factor theory has given impetus to an actuarial approach to vocational development in which are couched probability statements of success and failure in terms of specific tasks or jobs. The logic of trait and factor approaches is reflected in the assumptions that individual differences can be observed and classified in terms of certain variables; occupational requirements can be classified in analogous ways; and, thus the individual

can be "matched" to the right occupation. Such assumptions represent both the strengths and the weaknesses of trait and factor approaches to career development. Trait and factor approaches have been primarily oriented to specific occupations or to specific tasks but career development is not concerned solely with the choice of an occupation per se but rather with a process by which such choices can be purposefully integrated in a patterning of decisions through which an individual plans and implements his measurable traits as well as their personal meaning to him. Further, trait and factor approaches are static in nature. They do not provide for or consider systematically, the dynamics, the changing nature of the individual or the environmental characteristics to which he must relate himself.

An implicit derivation of trait and factor theory which pervades much of the thinking about career development is economic in origin. The assumption is made, based upon Keynesian economic theory, that one chooses a career or an occupational goal which will maximize his gain and minimize his loss. The gain or loss is, of course, not necessarily money but can be anything of value to a particular individual. Frequently, this approach assumes that all choice-making is positive. However, individuals frequently choose to escape from an undesirable situation by choosing a lesser evil rather than moving to a positive good. This approach does emphasize the importance of levels of investment--training, time, or energy--and of risk--the relative probability of outcomes--as these contribute to the ways by which different individuals approach choices.

A third approach to career development is sociologically based. It has become increasingly clear that the social structure of which one is a part has a great deal to do with the viability of the choices which are made. Thus, there are limitations placed upon career development by restricted social class horizons. Much floundering in decision-making is a result of limited avenues of career choice or limitations upon the knowledge of opportunities available to the individual so restricted. Indeed, such an approach also recognized by implication the dilemma of a favored and gifted youngster who has so many choices that are relevant that he finds tremendous conflict operating as he chooses. However, the individual of restricted social support blunders in or finds himself in jobs without any purposeful selection of his part, because the only guideline he has is immediate gratification. Thus, the narrowness or the breadth of the individual's cultural or social class horizons has much to do with the choices he can make, can consider, or can implement. For example, the conditions of poverty produces a distinctive milieu that conditions the social responses, the educational attainment, the vocational ambition, and the general level of intellectual competence of many of those raised within its stifling precincts. And, each of these elements has important correspondence with the level and the meaningfulness of career development which can be expected.

A fourth approach is one which can be described as a complex information processing model. It suggests that the magnitude of the information, of the factors which need to be considered, in career development is so overwhelming that the individual prematurely selects a career, and supports his selection by rationalization, or by a process which Festinger (1957) calls cognitive dissonance, without sufficient thought to the implications of the choice. Although the chooser knows there are other options which might be more compatible with his needs and personal characteristics it is comforting to make a selection and suppress the costs of its unrealism by a variety of self-deceptive devices.

A fifth approach is based in need or personality theory. The major assumption of this approach is that because of differences in personality structure individuals develop certain need predispositions, the satisfaction of which are sought in occupational choices and ultimately through career development. This hierarchy or pattern of personal orientations directs the individual toward an environment within which can be found satisfaction or a reduction of needs. Such an approach gives more emphasis than the others cited to genetics, child-rearing practices, and early childhood experiences as these relate to later vocational behavior.

The sixth and final approach to be considered here is that which gives major emphasis to the importance of the self-concept. Self-concept approaches to decision-making and career development can be separated from personality or need approaches not because they reject the latter but because their emphases are more developmentally focused and the importance of the self-concept, as the integrating construct, is accentuated. The assumption is made that individual behavior is shaped by one's self-concept system, the pictures which one has of himself in different roles, which he attempts to implement through career development and in specific choice behavior. One learns through experience and by socialization what kind of person he is, that of which he is capable, what he values, his strengths and weaknesses, and the kinds of outlets which will be compatible with the pictures he has of himself. This is a dynamic model which provides for change in individual behavior, change in environmental expectations, and change in the interaction between the individual and the environment. Rather than espousing only the concept of compromise among options, or the "chance" variables expressed by error and accident, it emphasizes the importance of progressive synthesis in role clarification and in choice options.

The collective finding of these several approaches to career development is that career development like all human behavior is complex. Like other developmental processes, individuals will differ in their readiness level and in the ways by which they develop. Thus, not everyone will reach the same point at the same time. Career development is integral to the total fabric of personality development broadly conceived. It is characterized by progressive development within a network of impinging forces intrinsic and extrinsic to the individual. Career development and choice behavior develop through processes of growth and learning which extend from infancy through at least young adulthood. Choice behavior involves a series of interdependent decisions which are to some extent irreversible. The factors which interact with choice-making and which need to be developed include personal capacities, interests and values; the availability and the requirements of training; opportunities available in the occupational structure; and, the self-concept as it is cast against such relationships as self in institution, self and environment, and self-in-process.

Vocational behavior and career selection develop from less effective behavior and unrealistic or fantasy choices to more complex behavior, more specifically in selection and more realistic choosing. The dimensions of such convergence effects are seen in the work of Tiedeman and O'Hara (1963) who describe choice anticipation as involving substages of exploration, crystallization, choice and clarification; Super (1963) who describes the exploratory stage as involving substages entitled tentative, transition, and trial (little commitment) and the earlier work of Ginzberg, Ginsburg, Axelrod, and Herma (1951) in their choice paradigm involving fantasy, tentative and realistic progression. Specific choices and decisions are seen as intimately tied to one's personal history and personal perceptions of the future, to both antecedent experiences and future alternatives.

Career development theory indicates that individuals progress through life stages which place upon them different expectations in terms of the specificity and the realism of career choice and these are mediated to a large degree by the cultural strata and the socio-economic class of which one is a part. Thus, what one becomes as a person as well as in the vocational sense depends upon his mastery of an array of developmental tasks, including specific learning tasks, which find their genesis in the early years of the family.

Because of the importance of early childhood experiences in the family, the school and the community, intervention in career development needs to begin during the first decade of life. This is the nursery of human nature and the time when the attitudes are formed which ultimately are manifested in vocational commitment or rejection. Youngsters in elementary schools must be exposed to experiences which are meaningful in terms of their individual characteristics and to information which is accurate if they are not to carry residuals of exaggeration and over-romanticized occupational stereotypes into later decision-processing. Further, it is relatively futile to expect one in early or mid-adolescence to commit oneself to a specific occupational choice, except as he rejects the normal cultural expectation to involve himself in education, but it is possible and central to this life stage to wed occupational and educational information to vocational exploration. If career information is to be meaningful to students it must be cast in terms of the questions students are asking themselves and in a format which responds to the language system, readiness level, and stage of development at which they are located. To be effective career information should include not only objective factors like earning possibility, training requirements, and numbers of positions available but also the social and psychological conditions in which the work activity is performed.

Career development theory also emphasizes the importance of providing youngsters experiences which enable them to identify and try-on suitable work roles. Probably the richest source of these opportunities for most young people is part-time work experience. But to receive maximum educational value, the stimuli which work provides must be analyzed in relation to the self. Work is not the only way to test reality. Curricular experiences and extra-curricular experiences if used with purpose, analyzed, and placed into a context meaningful to the individual can serve this purpose well.

Career development theory also points out that decision-making involves action. Thus ways must be found to help students take responsibility for their own learning and increasingly for their own direction. They need to be more involved in planning. To learn to be responsible and to be involved you have to be given responsibility and involvement.

In sum, as the findings of career development have unfolded, the emphases attendant to guidance and the aspects of education which have vocational implications have shifted from a Parsonian model of matching men and job to a model more committed to the clarification of those aspects of self--e.g. interests, capacities, values--which need development for a lifelong process of planning and decision-making. Within the individual must be fostered a conscious awareness that he <u>does</u> have choices, he must be assisted to verbalize and make explicit those choices with which he is presented, and to translate these into action. The base of alternatives from which individuals conceptualize choice must be made broader than the dichotomy between work and college. The alternative plans of action which ensue must be tested against a clarified value system within which are recognized and implemented concepts related to the risk function as a basic and essential reality. The individual must be encouraged

and assisted to determine at any given choice point what kind of decision is involved and the factors inherent in the decision that make a difference to him. Such expectations cannot be accomplished by any set of specialists alone but must pervade and be reinforced throughout the educational process.

Behavioral Goals

Vocational or career maturity is by definition the goal toward which career development is directed. Can such an abstraction be used to create unifying themes and behavioral descriptions which can serve to facilitate the steps leading to such a goal? In other words can vocational or career maturity be dissected into the elements which make it up and educational experiences built around these elements? In the discussion of career development theories it was noted that developmental tasks and stages of increasingly mature behavior have a strong partnership in these frames of reference. Several theorists, among them Havighurst (1953), Erikson (1950), Super (1957, 1963), Tiedeman and O'Hara (1963), Gribbons and Lohnes (1968) have discussed the presence of such phenomena in career development.

What utility might a development task concept or its sub-elements have in creating a unified system of education built around a career development theme? A developmental task has been defined by Havighurst (1953, p.2) as "a task which arises at or about a certain period in life of the individual, successful achievement of which leads to happiness and success with later tasks, while failure leads to unhappiness in the individual, disapproval by society, and difficulty with later tasks." This definition has come to be accepted rather universally as the major interpretation of this concept. Those who are involved with developmental task formulations generally agree on the following statements:

1. Individual growth and development is continuous.

2. Individual growth can be divided into periods of life stages for descriptive purposes.

3. Individuals in each life stage can be characterized by certain general characteristics that they have in common.

4. Most individuals in a given culture pass through similar developmental stages.

5. The society makes certain demands upon individuals.

6. These demands are relatively uniform for all members of the society.

7. The demands differ from stage to stage as the individual goes through the development process.

8. Developmental crises occur when the individual perceives the demand to alter his present behavior and master new learnings.

9. In meeting and mastering developmental crises, the individual moves from one developmental stage of maturity to another developmental stage of maturity.

10. The task appears in its purest form at one stage.

11. Preparation for meeting the developmental crises or developmental tasks occurs in the life stage prior to the state in which it must be mastered.

12. The developmental task or crisis may arise again during a later phase in somewhat different form.

13. The crisis or task must be mastered before the individual can successfully move on to a subsequent development stage.

14. Meeting the crisis successfully by learning the required task leads to societal approval, happiness, and success with later crises and their correlative tasks.

15. Failing in meeting a task or crisis leads to disapproval by society (Zaccharia, 1965).

Thus, the developmental task concept can be used to describe a nomothetic or average set of demands or requirements with which individuals must cope as well as a way of looking at how a given individual is attaining such expectation, where he may be having difficulty, what specific experiences or competencies he needs to acquire, and what resources might be committed to his needs. Such a concept permits a sequential development of experiences which relate to emerging developmental tasks as well as an opportunity to prescribe on an individual base alternative strategies for coping successfully with the developmental task at which point specific difficulties obtain. Individual variation relative to the attainment of developmental tasks can be further considered in the sense that first, "a given task has a unique meaning to each individual....secondly, individuals vary with respect to their general approach to developmental tasks....the third idiographic dimension of developmental tasks is the pattern of mastering developmental tasks" (Zaccharia, 1965). In the latter dimension, LoCascio (1964) has identified three basic patterns for mastering developmental tasks: continuous developmental pattern, delayed developmental pattern, and impaired developmental pattern. Obviously, the individual differences which contribute to such differential patterns relate to such factors as values, attitudes, need systems, age, sex, temperament, and cultural factors such as socio-economic class.

Developmental tasks can be utilized also as short-range, intermediate-range, long-range or ultimate goals as they are translated into criteria by which individual progress can be monitored. It is of principal concern that the specific sub-tasks or sub-elements which contribute to the accomplishment of developmental tasks be analyzed, monitored, and related to the development of specfic individuals.

As a framework for implementing this approach, Havighurst (1964, p. 216) has identified both broad and rather more specific developmental tasks in his analysis of the lifelong process of vocational development. The gross stages and more specific developmental tasks are as follows. Only the developmental tasks of the first and third stages will be identified.

	Ages
I. Identification with a worker.	5 - 10
Father, mother, other significant persons.	
The concepts of working becomes an essential part of the ego-ideal.	

Principal Developmental Tasks of Middle Childhood.

1. Developing fundamental skills in reading, writing and calculating.

2. Learning physical skills necessary for ordinary games.

3. Learning to get along with age-mates.

4. Learning an appropriate masculine or feminine social role.

5. Developing concepts for everyday living.

6. Developing conscience, morality, and a scale of values.

7. Achieving personal independence.

II. Acquiring the Basic Habits of Industry 10 - 15

Learning to organize one's time and energy to get a piece of work done (School work, chores).

Learning to put work ahead of play in appropriate situations.

III. Acquiring Identify As a Worker in the Occupational Structure 15 - 25

Choosing and preparing for an occupation.

Getting work experience as a basis for occupational choice and for assurance of economic independence.

Principal Developmental Tasks of Adolescence

1. Achieving new and more mature relations with age mates of both sexes.

2. Achieving a masculine or feminine social role.

3. Achieving emotional independence of parents and other adults.

4. Achieving assurance of economic independence.

5. Selecting and preparing for an occupation.

6. Acquiring a set of values and an ethical system as a guide to behavior.

7. Preparing for marriage and selecting a mate.

8. Starting a family.

9. Getting started in an occupation.

IV.	Becoming a productive person.	25 - 40
	Mastering the skills of one's occupation.	
	Moving up the ladder within one's occupation.	
V.	Maintaining A Productive Society	40 - 70
VI.	Contemplating A Productive Life	70+

Although the developmental tasks identified by Havighurst in this illustration are too gross to be of much operational utility, several pertinent points are valuable. If one looks at the first gross stage, identification with a worker, what does this suggest for a student who comes from a home and a culture where there are no productive workers? If the achievement of later tasks is predicated upon the success of such identification it requires education to respond to that lack in the case of this individual. In accordance with Havighurst's belief that one must repeat a missed stage before going on, what resources, what role models, what experiences can the school provide which will help this particular youngster acquire a concept of work as a part of his ego-ideal?

There is another implication here. If, for example, the development of fundamental skills in reading, writing, and calculating are critical to later developmental success, and there is no doubt that they are, and if developing a concept of work as a part of one's ego-ideal is also essential can these concerns not be mutually addressed through materials and experiences which help children to learn to read, write, and calculate about work-oriented topics? The answer seems to be obviously affirmative.

One final point here. The developmental tasks of Stages I and III clearly indicate a process of increasing specificity through thema which become more intense as one ages. As examples, development of a value system, acquiring a sex-typed social role, achieving effective interpersonal relationships are each points along a fluid process which has specific manifestations at different points of time but has roots early in the life of the individual.

Another example of the longitudinal shaping of tasks which are relevant to ultimate vocational behavior is that provided in the work of Stratemeyer, Forkner, McKim, and Passow (1957, 208-214). In this illustration (See page 12a), a concept such as Using Effective Methods of Work, is broken into pertinent subaspects or sublevels like Planning on and Clarifying Purpose and then extended longitudinally across ages and contexts in which they might operate. Such a procedure permits the elaboration of a conceptual scheme which is built from the bottom up and provides the opportunity for building experiences on experiences which flow toward and from common denominators. This scheme also permits a gross profile of the experiential background which one is expected or assumed to have but which may not be present in the personal history of a given individual. Thus, it can be used to show instrumental relationships between present and future levels of expectation as well as for diagnostic purposes to determine what present experiences need to be acquired and what successes an individual might need to move from a particular developmental plateau to increasingly effective behavior.

Both of the illustrations cited provide a frame of reference from which to move in more specific operational terms. They both suffer from the gross nature of their content, the lack of current findings from career development

research and theory, and behavioral descriptions which permit evaluation of the degree to which an individual student has accomplished the behavioral goals set for him. Hull (1967) has examined one approach to this latter requirement which is relevant here. He states that, "Behavioral objectives couched in descriptive expectations for individual performance enhance evaluation efforts." Hull used as a conceptual scheme the work of Bloom, Engelhardt, Furst, Hill, and Krathwohl (1956) in which the cognitive domain was divided into six classes: knowledge, comprehension, application, analysis, synthesis, and evaluation. These classes represent spiraling complexity of individual cognition. Hull applies this schema to the evaluation of pupil attainment in vocational tasks in each of six occupational fields. Most importantly, for the purposes here, he defined the tasks in behavioral descriptions, the attainment of which can be measured. His work is as follows:

Occupational Field	Objective Class	Operationally Defined Tasks in the Cognitive Domain
Office Occupations	Knowledge	To spell a list of fifty "most difficult" words correctly
Carpentry	Comprehension	To lay out a rafter cutting diagram for a gable roof with a 1/4 pitch
Food Service	Application	To serve a full-course dinner to a party of eight persons quickly, efficiently, and without disrupting conversations
Distribution	Analysis	To recognize unstated reasons for the customer's initial questions about a sales product
Production Agriculture	Synthesis	To plan a schedule of fertilizer application (time of year, type and amount of fertilizer, etc.) for a given crop rotation on a particular farm
Welding	Evaluation	To apply 60,000 pounds of pressure per square inch to a butt weld of 3/8 inch mild steel

Hull, of course, applies his example to vocational tasks which are more related to the acquisition of occupational skills than to the concepts of career development and his illustration represents a point in time rather than a longitudinal process. But the wedding of a cognitive concept to a specific behavior which can demonstrate the acquisition of the skills inherent in the concept is the major point. With some juxtaposing of time and space, without consideration of the occupational field labels in the first column, one can see how the concepts of knowledge, comprehension, application, analysis, synthesis, and evaluation could correspond to the developing characteristics of groups of children or particular children in a longitudinal schema for fitting experiences to the complexity of unfolding abilities.

Although Hull's framework used as a model the analysis of the cognitive domain by Bloom et al, there is a more recent companion piece dealing with the Affective Domain (Krathwohl, Bloom, and Masia, 1964). Stripped of their definitions, the category and subcategory titles which embrace the spiraling hierarchy of affective complexity is as follows:

1.0 Receiving (attending)

- 1.1 Awareness
- 1.2 Willingness to receive
- 1.3 Controlled or selected attention

2.0 Responding

- 2.1 Acquiesence in responding
- 2.2 Willingness to respond
- 2.3 Satisfaction in response

3.0 Valuing

- 3.1 Acceptance of a value
- 3.2 Preference for a value
- 3.3 Commitment (conviction)

4.0 Organization

- 4.1 Conceptualization of a value
- 4.2 Organization of a value system

5.0 Characterization by a value or a value complex

- 5.1 Generalized set
- 5.2 Characterization

Krathwohl has stated (1965) "If the analysis of the cognitive and affective areas is correct, then a hierarch of objectives dealing with the same subject matter concepts suggests a readiness relationship that exists between those objectives lower in the hierarchy and those higher." Thus, the taxonomies of the cognitive and the affective domains provide models which can be extended longitudinally, which can be used to represent nomothetic expectations which can be translated into profiles of individual development, and to which can be related experiences designed to facilitate progress in particular categories of development.

The question now becomes, how can the input from current work in career development be placed in some specific way into a model which is longitudinally viable, which lends itself to behavioral description, and for which facilitative experiences might be designed? Two examples will be cited. Both contribute elements making up vocational maturity which fall principally within the cognitive domain. The first example comes from the longitudinal research of Gribbons and Lohnes (1968, 15-16). They have examined the concept of Readiness for Vocational Planning which has been cited as a measure of vocational maturity during adolescence. They have identified eight variables which in combination correlate to a high degree with readiness for vocational planning at the eighth grade and at post-secondary school levels. They are:

Variable I. Factors in Curriculum Choice

Awareness of relevant factors, including one's abilities, interests and values and their relation to curriculum choice; curricula available; courses within curricula; the relation of curriculum choice to occupational choice.

Variable II. Factors in Occupational Choice

Awareness of relevant factors, including abilities, interests, values; educational requirements for choice; relation of specific high school courses in choice; accuracy of description of occupation.

Variable III. Verbalized Strengths and Weaknesses

Ability to verbalize appropriately the relation of personal strengths and weaknesses to educational and vocational choices.

Variable IV. Accuracy of Self Appraisal

Comparison of subject's estimates of his general scholastic ability, verbal ability, and quantitative ability with his actual attainments on scholastic aptitude tests, English grades, and mathematics grades.

Variable V. Evidence of Self-Rating

Quality of evidence cited by subject in defense of his appraisal of his own abilities.

Variable VI. Interests

Awareness of interests and their relation to occupational choices.

Variable VII. Values

Awareness of values and their relation to occupational choices.

Variable VIII. Independence of Choice

Extent of subject's willingness to take personal responsibility for his choices.

The other example is from the work of the Career Pattern Study, a longitudinal study of career development directed by Super. The example used here is from the first of five gross vocational development tasks which are respectively: Crystallizing a vocational preference, Specifying a vocational preference, Implementing a vocational preference, Stabilizing in a vocation and Consolidating status and advancing in a vocation. Super and his colleagues have indicated that the first of these, crystallizing of a vocational preference, is the process of formulating a generalized vocational goal. It takes place in early and middle adolescence, and, it is essentially and, at its best, a cognitive process.

Attitudes and behaviors associated with the vocational development task, crystallizing a vocational preference, include the following: (Super et al, 1963, 84-86)

1. Awareness of the need to crystallize -- The behaviors which constitute this attitude are often verbal as illustrated by voluntary discussion of the need to choose a career, but they are also frequently instrumental, as in the case of going to the school library to read an occupational pamphlet, or seeking an appointment with the counselor.

2. Use of resources -- Relevant instrumental behaviors are consulting with counselors and other sources of occupational information and self-understanding, reading occupational materials, seeking part-time or vacation jobs in one's field of interest.

3. Awareness of factors to consider -- A cognitive process in which the individual takes into account self and situational factors which affect the wisdom of a preference: intellectual requirements, interests for which outlets are possible, accessibility, security, the timing of choices and the need for alternatives. Relevant behaviors are largely verbal and involve expressions of the importance of a given consideration, self-awareness, and knowledge of situational factors.

4. Awareness of contingencies which may affect goals -- Seems more likely to assist in ruling out some possible preferences, in narrowing the field of preferences, and in providing a basis for greater stability of whatever preferences are crystallized. Relevant behaviors are largely verbal and include statements concerning the need for parental approval of preference and plans, of the need for continuing financial support may also be instrumental.

5. Differentiation of interests and values -- Shown by depth and patterning as in inventoried interests and values, by the degree to which a person makes some low and some high scores, as contrasted with all average scores on an interest or values inventory. The behaviors in this instance are verbal behaviors recorded in inventories, but they could also be instrumental behaviors manifested in extracurricular activities, clubs and hobbies.

6. Awareness of present-future relationships -- Consists of relating present prevocational activities to intermediate and ultimate vocational preferences. Relevant verbal and motor behaviors are illustrated by the mention of the fact that choosing algebra is essential to entering engineering school, and by taking blueprint reading in order to help qualify for advancement to skilled factory employment.

7. Formulation of a generalized preference -- Self and situational awareness, crystallized interests and values, make possible the formulation of a generalized vocational preference. In many cases, this may seem to be a specific occupational preference, but it is in fact a more general occupational-type preference. In such cases, the occupational title serves as the symbol of a number of related activities for which liking is indicated.

8. Consistency of preference -- Consistency of preferences at this age is largely verbal, but is may also be instrumental, as in the consistent election of subjects relevant to a particular vocation.

9. Possession of information concerning the preferred occupation -- Is manifested in verbal behavior, in which the subject reveals what he knows about requirements, training, duties, conditions of work, and so forth in the occupation which he prefers.

10. Planning for the preferred occupation -- Is a type of verbal behavior which can be characterized in the same way as possession of information. However, the focus is on decisions as to what to do and when and how to do it. The amount and specificity of planning like information, has been shown to be a measurable characteristic of vocational maturity in early adolescence.

11. Wisdom of the vocational preference -- shown in verbal behavior.

The elements of the Gribbons and Lohnes and Super et al data can be condensed and blended in several ways. It is clear in both that students need a comprehensive body of information which links what they are doing educationally at particular points in time to future options which will ve available to them within the context of education as well as within the context of work. Thus, they need to know what curricula will be available to them, what factors distinguish one curriculum from another, what components make up separate curricula pathways, what personal factors are relevant to success in different curricula, and how the various curricula are linked in an instrumental fashion to different field and level responsibilities in the occupational world.

Students also need self-knowledge. They need to be able to differentiate personal values and personal interests as these are related to personal strengths and weaknesses in the several manifestations of ability -- verbal, quantitative, scholastic. They need to be able to assess these elements of the self, incorporate their meaning into the self-concept, and relate the relevance of self information to the choices with which they will be confronted.

Transcendant to this necessary base of knowledge is the motivation to use it in purposeful ways. Or, as Clarke, Gelatt, and Levine (1965) observe to develop "an effective strategy for analyzing, organizing, and synthesizing information in order to make a choice." There is in the making of decisions, skills which can be learned. Once a person has made a plan for some segment of his life which he is content to live by, he is better able to make the next one intelligently and with less hesitation or conflict. As has been indicated previously, one cannot make vocational decisions without educational implications and vice versa. Nor can effective planning and choice-making occur without recognizing and assessing the psychosocial, emotional, implications inherent in the choice.

Inherent in the studies of Gribbons and Lohnes and of Super and his colleagues is the need for an attitude of planfulness to be generated in students as well as recognition of possible alternative actions, possible outcomes of these actions, probable outcomes of these actions, and the desirability of the outcomes as defined by personal preferences and values. In this context, students can be helped to assess the sequence of outcomes -- proximate,

intermediate, ultimate -- which lead from immediate choice, the factors which are personally relevant at each experimental branch point, the probabilities associated with those factors, and the personal desirability of the outcomes which make up the sequence. The facilitation of planfulness and of career development, then, involves not only knowledge, but opportunities to apply the knowledge to one's personal characteristics. It involves the student's willingness to commit to work a sense of value, ego-involvement, personal endeavor, and achievement related motives.

Education can equip students with accurate and relevant information which is translated in terms of the developmental level and state of readiness of individual children; it can encourage and assist them to formulate relevant hypotheses about themselves, the choice points which will lie in their future, and the environmental options available; it can help them use appropriate ways of testing these hypotheses against both past and new experiences; and it can help the student to come to terms with the educational relevance of what he already knows, or will learn, about himself and his future. In other words, students can be helped to see themselves in process and to acquire the tools and knowledge which will allow them to exploit this process in positive, constructive ways.

Can these expectations of education to facilitate career development be converted behavioral descriptions which can guide specific experiences? Several models have been suggested which can provide such a frame of reference. One of the operational goals critical to implementing the Exemplary Programs and Project Section of the 1968 amendments to the Vocational Education Act relates to the need to design behavioral descriptions which would encompass the characteristics of career development, placing these at appropriate developmental levels, and wedding them to educational strategies which will facilitate them.

Relationship Between Career Development and General Education

As one views general education it becomes quite clear that there is already operating a number of activities which are at least tangentially related to career development. In fact, all contacts with people, things, and ideas have potential for influencing career development (Roeber, 1965-66), if these are purposefully any systematically addressed to this expectation. The creation of the behavioral goals suggested previously as ways of bringing focus to the activities and experiences through which career development can be facilitated would be powerful means by which career development can be made to stand clearly as a central activity at all educational levels. The early work of Comenius and Dewey and the more recent work of Piaget and Bruner among others have supported the premise that success experiences and the realities of the adult society can be grasped and internalized by even very young children if these concepts are placed in a language system and an experiential framework which is attuned to the readiness level of the children being served.

It is important that general education be seen not just as an opportunity for the expression of certain personal characteristics which make up career development but rather that it be seen as devoted to developing these characteristics. Although this distinction is subtle, it represents the difference between purposeful, sequential development and development by chance and happenstance. Thus, a series of exposures to career development-oriented activities adapted to the developmental level of children and provided through different media will have an impact that isolated, compartmentalized experiences can never realize.

It is also important that any sequential development within general education recognize that if the present conditions of occupational illiteracy, lack of goal directedness, and nonemployability are to be overcome, a broader perception of the many types and degrees of talent necessary to the world of work must be fostered. If schools are in fact to develop the requisites of career development, emphasis must be given from the elementary school forward to the identification and facilitation of the positive elements, strengths, and talents, which for each individual represent the best coin for future career success. In addition, education must attend to the fact that support it in programmatic ways, that students will differ in their approach to career orientations and in their readiness for such thinking because of the high degree of interdependence between one's concept of self, his concept of occupations, and his environmental development. Educational practices must embody better and more comprehensive approaches to the diagnosis of where students are in their career development, in success with learning, in their interest and value formulations. Equally important, however, is the need to make available large numbers of learning experiences which can be related to individual needs and capacities. In the last analysis, the objective of education built around career development must be the development of the individual, not the needs of the labor market.

The discussion which follows is not intended to be exhaustive of the ways by which general education can facilitate career development but rather illustrative of some of the activities now underway at different educational levels from which systems to facilitate career development can flow. The discussion does not center about the specific roles which teachers or counselors can play in their respective professional endeavors to facilitative career development although it is only by the application of their separate skills and their cooperative behavior that a unified system of education through career development can be brought to fruition.

The Elementary School Level

If Luchins Primacy Affect (1960) is a valid premise -- that the information which is obtained first carries the most weight in ultimate decisions -- significantly more attention must be concentrated at the elementary school in terms of attitude development, decision processing, self awareness as well as awareness of and knowledge about the broad characteristics and expectations of work. Frequently, unrealistic vocational plans are made at this level because of the emphases on parental and community attitudes as well as in textbooks upon "prestige fields," which obscure the existence and the significance of other fields that employ a large proportion of workers. The occupations and careers exhibited should cover the full range of alternatives from unskilled and semi-skilled worker to Ph.D. However, the greatest stress should be placed on those jobs which do not require a four-year college education, but probably involve continuing education beyond high school.

Increasingly rigid walls have been erected between the pre-adolescent, and for that matter the adolescent, and the vocational niches or educational options to which they must relate. In far too many instances, large segments of our students population -- those from the culture of poverty and others -- have no systematic models to which to relate or psychological support for the quest for behavior which is personally and socially relevant. These conditions occur at a time when attitude formation is in its seed stages. Consequently, the total educational process must support and reinforce those experiences which will generate attitudes and self-acceptance ultimately having a vocational manifestation. Vocational values and

attitudes need attention prior to specific skill consideration although current levels of knowledge and procedures now incorporated in such areas as industrial arts could be placed in the elementary school with benefit to individual children. The integration of vocational values, attitudes, and facts, as well as the relationship between academic content and occupations as reflected in curriculum development, is a priority concern. Students must be helped to relate, in an instrumental way, what they are doing in the classroom to the expectations of varying work contexts. Teachers must be made sensitive to the fact that their attitudes toward work of various kinds make a significant impact on the attitudes of students as they develop personal perceptions of aspiration and prestige. It is in these gross ways that the objectives of guidance, career development, and general education must interface and infuse the formative experiences of children.

More specifically, though the creative use of curricular materials, films displays, role-playing, dramatizations, gaming and simulation, elementary school children can be introduced to career development concepts which are accurate and pertinent to their future development. This is not to suggest that elementary school children be robbed of their fantasies, but rather that their fantasies operate from a base of knowledge instead of overromanticism and stereotype. Almy (1955, p. 200) states that the six year old lives more in a world of reality and less in a world of phantasy. We can understand a number of relationships in the physical world....He knows his actions have consequences for other people and is more alert to their responses and feelings." Jersild (1951) too, has indicated that children have at an early age greater capacities for learning to meet, understand, and deal effectively with realities than has been assumed in psychological theories or in educational practice. Certain of the behavioral objectives discussed previously can be introduced in different stages of the elementary school and identification of those students requiring specific experiences to cope with the developmental tasks demanded of them can be placed in process.

Gross (1967) has suggested that preparation for work life involves four dimensions: (a) preparation for life in an organization, involving authority, security quests, impersonality, routine, conflict, mobility, and demotion; (b) preparation for a set of role relationships; (c) preparation for a level of consumption, involving a certain style of life, and (d) preparation for an occupational career, involving changes in the nature of jobs, and different types of jobs depending on the position in the life cycle. Such topical areas would seem to lend themselves to language arts, social studies, science, geography or, in fact, virtually any elementary school endeavor. Such themes are not confined to the elementary school population but could create organizing concepts which spiral in increasing complexity throughout the educational continuum. Blocher (1966) too, has discussed the importance of social roles as they relate to developing human effectiveness. Students could examine social roles as they relate to leadership, creative or original contributions, helping relationships, and unusual levels of accomplishment. The study of social roles could be extended to occupational fields and levels of responsibilities as well as to such areas as coping behaviors and their implications for growth and development.

Goff (1967) demonstrated in two socio-economically different elementary schools that measurable increments in vocational knowledge, level of occupational aspiration and realism of occupational choice can be attained through a planned vocational guidance program. Stress was placed upon developing a respect for all levels of human endeavor, toward gaining an understanding of personal strengths and limitations, and toward acquiring

satisfaction in the task of learning itself. Children were asked to work through the making of occupational choices for the purposes of testing and discussion as well as to reinforce the idea that early and specific choices were not expected at the elementary school levels.

In an attempt to determine whether primary grade children could gain occupational awareness important to vocational attitude and value formation, Wellington and Olechowski (1966) found that eight year old youngsters could: develop a respect for other people, the work they do, and the contributions made by providing production and services for everyone; understand that occupations have advantages and disadvantages for the worker; understand some of the interdependent relationships of workers. The group of students with which Wellington and Olechowski worked was first exposed to a unit of study entitled "Shelter". The building industry and the variety of workers related to the industry were explored. Initial indications were that youngsters at the conclusion of the unit did not yet understand the workers' role and function. Follow-up discussions were then focused on methods for increasing the children's understanding. The students were assigned to interview a variety of workers. With the assistance of the teacher and the counselor, the students developed questions to be asked in the interviews. The interviews and the class discussions which followed were taped. After the children listened to the tapes and completed their discussions concerning the building industry and its workers, there was a significant increase in the students' understanding and awareness of working people and their work. The important point is that the initial lack of increased student awareness was a result of faculty techniques not a lack of student ability to grasp the concept.

Vocational guidance or exploration at the elementary school level and later cannot be confined to an informational service although relevant, comprehensive information is vital. Arbuckle (1963) has suggested that the world of work be viewed at the elementary school level as a "world of people" thus emphasizing the importance of individual characteristics in shaping one's future work life and to diminish the remoteness, the outside-the-person focus, which work is perceived frequently as being.

Kabach (1966) has indicated that "the younger the child the greater the interest in the actual job performance itself. Most children are natural born actors; they want to act out in order to understand what it feels like to be a carpenter or a ball player." There are several important implications here. First, in terms of media or vocational exploration, in the elementary school particularly, the use of dramatizations, role-playing, simulation each has potential for allowing youngsters to try on possible occupational roles. Secondly, it is possible to facilitate student identification with attainable vocations represented in their immediate neighborhoods or community. Finally, if children base their occupational preferences on job performance itself this is a prime time to introduce them to the relationship between interests and occupational areas. An array of experiences can be built upon how interests develop and their importance in life. Interest themes can also be related to change as a process, to capacities, to values, to decision-making or any other process.

A set of materials encompassing these concepts specifically designed for use in grades five, six, and seven were developed by personnel of the Abington School District in Pennsylvania under a grant from the Pennsylvania Department of Public Instruction. The model they developed drew upon the resources of the school, home, and community. As one piece of this model,

six sessions were developed so that they could be integrated in the language arts curriculum and, thus, contribute to student development in the area of spoken and written communications. The objectives for these sessions were met through

1. A card game which demonstrated how interests develop

2. Short stories based upon characters with whom students could readily identify

3. An interest inventory designed to obtain a profile of the interests of students through media which were relevant to their age level

4. An "open-ended" play illustrating the influence of interests on personal relationships which provided students the opportunity to write the second act showing the outcome of the situation

5. A taped series of role-played interviews with various workers in which the students were to determine the occupation from the interests described by the person interviewed.

Similar experiences were created to facilitate awareness of change, values, educational and occupational relationships and similar pertinent concepts as these interacted with student development.

In a sense, many of the possibilities for influencing awareness of career development in the elementary school are built around the premise that at the base of later career differentiation and integration must be a foundation (O'Hara, 1968). And, this foundation has as a basic ingredient the development of a language of vocations, a base for personal imagery and symbolization. Through the acquisition of relevant words, children begin to accomodate to cues by which to differentiate and integrate both the world around them and themselves as part of this world.

Junior High School Level

Many of the concepts and methods introduced at the elementary school level can be reshaped and extended to the junior high school level. It must be remembered, however, that as a result of experience and growth students at this level have needs and abilities which are different from those of elementary school pupils and from secondary school pupils. Students of this age level are more able than elementary school pupils to comprehend relationships and to use abstract terms and symbols; they are in a period where they are preoccupied with belonging and conformity while they are also attempting to achieve independence from their families and sort themselves from the mass. They are enmeshed in the continued development, refinement, and strengthening of basic academic skills begun in the elementary school and they are beginning to converge on the more specialized experiences of the secondary school. Because specific choices of curricula or of the specific high school they will attend are rapidly approaching, however a theoretical that might be, their sensitivity to work and its personal relevance to them as creatures who will "become" is accentuated. It is a period where intensive almost frenetic exploration can be expected. It is also a period where many students will absent themselves from formal education permanently. It is a period when such career development concepts as compromise become operational

as realities and ideals are reality-tested through curricular and extra-curricular experiences. Thus, experiences designed for these students must be timely and immediate to the questions which they are asking themselves. It is a time when student responsibilities through participation in planning can be related to the consequences of decisions made. It is a time when sex differences exert important influences in curriculum choice and when choice considerations become different in kind and value for males and females (Cass and Tiedeman, 1960). It is also a time when because of the unevenness of development, there are wide ranges of maturity within the population and within individuals.

It is inevitable that the junior high school student will move toward a conception of self as seen against a background of work. For some youngsters at this level purely academic content holds no appeal at all unless its immediate relevance to salable skills can be made obvious. These students need access to a skill-centered curriculum, to vocational education if you will, at what is organizationally the seventh through ninth grades. If they do not receive this opportunity, the chances are that they will leave the school as unemployable. Some of these young people do not have the tolerance or the ego-strength to wade through a morass of personally-meaningless experiences until the ninth, tenth, or eleventh grades when they can get their hands on the tangible and the concrete. This is not to imply that these students should not be provided the experiences which will facilitate career development beyond the narrowness of task skills. Indeed, it is within the context of skill development that they can be helped not only to see where they might go but prescriptions of the specific ways by which they can implement their goals can be created. For these persons for whom skill-centered learning is most relevant and the source of success experiences, training in decision-making and in planning which transcends job layouts, can facilitate their self-understanding and their recognition of alternative goals to which they can respond. The concept of continuing to learn throughout one's work life through apprenticeships, on the job-training, post-secondary vocational/technical schools and other experiences can be introduced and explored.

Integral to skill-centered access for some students and different exploratory experiences for students not requiring skill emphases is work itself. Work for many students will be the best of all try-out experience. For some students, organized work and study programs are ways of shortening the period of economic and psychological dependence under which so many youth chafe. To facilitate career development, however, such work experience should be more than casual, unsystematic ventures into whatever chance opportunity presents itself. Rather, the behavioral goals to be attained within the developmental task frame of reference previously elaborated are pertinent here also. They represent motivational as well as diagnostic possibilities to which work can be related. If such a possibility is to be realized, however, education and industry will need to come together in mutually creative exchanges in order to provide such opportunities systematically. This would seem to require that schools accept a placement responsibility for placing youth in jobs on a part-time or summer basis where they can make use of what they have learned.

If work as a try-out experience cannot be made available to all junior high school students or if it is not relevant for some individuals, one of the alternatives is the purposeful wedding of educational technology to career development. To this point, educational technology has been more concerned with how to communicate rather than what to communicate. It has, however, clear and powerful potential in simulating career development and decision-making processes, contingencies and outcomes, as well as a medium for

translating informational retrieval in terms of individual needs. Many relevant projects already exist. Among these are the following:

1. The work of Loughary, Friesen, and Hurst (1966) in developing Autocon, a computer-based automatic counseling simulation system.

2. The development of a Man-Machine Counseling System (Cogswell, Donahue, Estavan, and Rosenquist, 1966) which among other things will track students through their school progress by computer to identify counseling problems and automate interviews to help students in the areas of course programming, post high school educational planning and vocational exploration.

3. The computerization of vocational information using Roe's field and level classification and relating student information to this classification for the purpose of conversation between computers and students about decision-making (Harris, 1968).

4. Life career games, in which students plan the life of a fictitious student within simulated environments and receive feedback on the possible consequences of their decision (Boocock, 1967).

5. The work of Gellatt and his associates in the Palo Alto public schools in which locally developed probability data as well as general probability data available from government and commercial sources were used in the group guidance program. A control group which received no probability data was also included. In an evaluative design integral to this project, it was found that the group which received local probability data scored significantly higher on knowledge about the process of decision-making, awareness of high school and college alternatives, and knowledge of the probabilities involved in these alternatives than did the group receiving general probability data or the control group which received no probability data (Yabroff, 1964).

These projects are not intended to supplant teachers or counselors, but it is probable that with increasing sophistication the outcomes of these projects will cause a reordering of the possible uses to which teachers and counselors can put their energies.

To return again to curriculum content per se, it is necessary that a body of content be identified which is relevant here. The concept of change as it relates to characteristics of the self and to environmental options has been mentioned as a thread which can complement career development. At the junior high school such a theme can be related to implications of accelerating application of new technological discoveries to the occupational structure. It can reinforce the validity of preparing oneself to be versatile and yet firmly grounded in the fundamental processes which undergird all occupations. Such a continuing concept can be related to work habits, mechanical principles, electrical principles, structural design and representation, chemical and biological principles, numerical operations and measurement, verbal communication as this is related to supervisor-subordinate relationships and human relationships. In this context, students can be increasingly encouraged to ask not only whether I like it? but What does it take? and Do I have what it takes? In addition to simulated and work experiences, these kind of questions can be tested in various courses. Students can be encouraged to ask such questions as Why am I taking chemistry or algebra or English and how can I

use it? And, teachers must be encouraged to respond to this question as one for which they are fairly specific answers.

A relevant technique for synthesizing many of these suggestions is that used by Lockwood, Smith, and Trezise (1968). They took the position that if students are even to begin making meaningful vocational investigations they must first become more aware of the almost infinite possibilities that are open to them -- their world must be enlarged. Students were, therefore, introduced to four worlds: the Natural, the Technological, the Aesthetic, and the Human world. In the Natural world, the students studied not only what nature has to offer men both materially, and spiritually, they also looked into man's preoccupation with the destruction of nature. In the Technological world, topics dealing with machines, mass production, automation, cybernetics, and computers were used to stimulate students to discuss not only how developing technology will affect jobs of the future, but more broadly, what will it do for man and society as a whole? In the Aesthetic world, students discussed the role of the arts in modern society and the place of the artist, contemporary trends of art, the "culture boom", and why the arts must have a vital place in any mature culture. In the Human world, students studied overpopulation, poverty, war and peace, social injustices and the individual in mass society. The important dimension here is that the students discussed career areas related to each world and the interrelationships among them.

Senior High School Level

The continuation of career development at the senior high school level must as at other levels be predicated upon individual needs, readiness, and motivations. In one sense the principal concern at this level is the intensity of the planning, individual readiness, and goal-directedness which characterizes the individuals to be served. Specific career development activities must take each student from where he is to the creation and the achievement of a set of specific goals. Here perhaps, more than at any other point in the educational continuum, activities must be individually prescribed and they must proceed with logic and system to permit the realization of future motivations whether these be immediate job acquisition, post-high school technical training, baccaleureate preparation, or a potential future mix of each.

If the architect's dictum, that form should follow function is valid, then institutional shapes and organization will need to incorporate more flexibility, more interdisciplinary integration, variable time blocks, individualized programming, multi-media approaches, and self-teaching devices than is presently characteristic of most educational systems.

Because of the importance of fundamental cognitive skills -- e.g., reading, writing, computing -- to career development, many students will need renewed efforts to attain these skills through remedial or individualized methodology. But their acquisition can be facilitated by placing them in the context of vocational experiences. One of the exciting possibilities for doing this lies within the cluster concept which blends an interdisciplinary approach to academic learning with a family of skills or career clusters which are broadly applicable to many jobs. Through the E S 70 program pilot projects are already underway in such places as Quincy, Massachusetts, and in the Richmond Pretechnical Program, San Francisco, to use students' occupational interests as a means of developing his general and academic skills. Lessons are not separated into such courses as physics, math, English or electromechanics; they are interwoven in ways which insure that students have attained

skills which are salable but which permit students the opportunity to qualify for advanced training at the junior college level or in other post-secondary educational endeavors (Bushnell and Rubel, 1968). Thus curricula can be blended in ways which emphasize both the acquisition of technological principles and the personal skills which permit one to make use of the technical skills which are acquired. Theoretically at least, one can train a young person to be the finest machinest in town but unless he is given the personal skills and attitudes which permit manifestation of the technical skills e.g., be willing to be at work at 7:00 a.m., five days per week each week, he is still unemployable.

If career cluster curricula could be developed beginning at the ninth grade, this would not preclude the continuation of specific job training for some students. Not all vocationally oriented students are capable of or desire preparation for the skilled trades or for technical occupations. Specific programs must be developed for the low end as well as the high end of the intellectual continuum whether such preparation is to be a helper, a dishwasher, a waiter, a lawnmower repairman, an industrial landscape gardener or whatever. Indeed, low intellect aside as a rationale, pathways to constructive work must be broadened so that youth are not fitted to programs but programs are fitted to youth. The existing lockstep of certain training durations and specified training experiences must be broken to exploit the enlarging opportunities in the occupational world to use the talents of individuals characterized by a wide range of capability. The specialty-oriented youngsters (Hoyt 1963), who are not solely representative of those with limited intelligence, can be provided clusters of job skills in such areas as social and public services, transportation, management, finance, business communication, distribution -- areas which are not mechanical or theoretical, if such dichotomies are viable, but are nevertheless tangible, concrete, and important outlets for a range of personal predispositions.

Integral to any of these conceptions of creating vocational experiences and tying them to academic learning in meaningful ways is the opportunity for individual and group problem-solving. These opportunities must span educational levels. Students can be helped to identify and define problems to be solved within the context of current vocational experience and ways can be identified to solve the problems. Students can participate in planning projects which exploit decision-making behavior and through which their own interests can surface.

At the senior high school level, the possibility of integrating work experience with schooling is a reality. The age and sex of the student are no longer the contingencies they are at the junior high school level. Blocks of time can be developed by which students will actually report to jobs instead of school for two or three weeks or perhaps a term at a time. While the economic appeal is obvious, the training and the exploratory potential needs to be fitted to individual needs. Hence, if a particular student is interested in business or in electronics, a program could be made available by which he can complete his high school work and simultaneously secure the on-the-job training available through part-time employment. For some students, this could be pre-technical training, for others it will be a permanent job, and for still others exploration prior to baccaleureate study.

All of this emphasis in the senior high school on vocational experience, career clusters, work is not to denigrate the continuing career development potential of the academic curriculum <u>per se</u>. The types of activities integral to curriculum but complemented by simulation devices and processes which have been indicated as possible at earlier educational levels are also important

in modified form at the senior high school level. A continuing career development theme in courses designed to prepare students for college will serve to diminish the persistent assumption that college is an end in itself. It, too, is an intermediate vocational choice for the vast majority of students who enter college. With such an emphasis, college will be seen less as a way of deferring career thinking and more as one of the alternative ways to achieve particular vocational goals. Indeed, many of the students for whom college is the immediate step following high school will also profit from direct work experience or from access to vocational experience in the school itself in order to heighten the purpose with which college is approached.

Relationships of Career Development and Vocational Education

Vocational education has been called the Bridge Between Man and His Work (The General Report of the Advisory Council on Vocational Education, 1968). If a career development theme is to be viable, such an appelation must come to describe the total educational enterprise not just a segment of it. If any one part or all of education is to deserve this label by bringing to reality in the lives of individual students the complex of experiences necessary to bridge education and work, more than narrowly defined job training is involved. It is this very specificity of trade or job training which has led to cries of obsolescence in vocational education and unresponsiveness to the dynamics of the occupational structure. As one evidence that these charges have some validity, the first nationwide study of the postgraduate employment experience of male graduates of trade and industry vocational courses shows that the majority of vocational course graduates do not, for their first job, enter the trade for which they trained in high school nor do many tend to enter the trade in later years (Eninger, 1965, p. 25). Thus, the intent and the patterning of vocational education as it is manifested in many current programs of education must be reshaped and reconstituted.

Virtually all of the relationships which have been suggested as pertaining between general education and career development, apply with equal force to vocational education. They will not be repeated here. Indeed, if such relationships are incorporated into a reshaping of the many thrusts of vocational education, the lines which presently separate or dichotomize vocational education and "general education" can be made to blur or vanish.

For too long vocational education has been seen as having validity only for a highly restricted sample of the total student population rather than for all students. Operationally, it has been seen as a second class alternative for those with low verbal skills or for those with technician interests. In the process, many of these students and many vocational educators have become defensive about their alleged inferior status, moved further into an isolationist stance, and tied themselves to training experiences rigidly defined by time and content. As a result, many students who desperately need what vocational education and vocational experiences can offer have been blocked from this access. Students have been arbitrarily separated into supposedly homogeneous categories of college-bound and non-college-bound, the experiences for each category being seen as mutually exclusive.

The alternative to releasing more of the potential contribution which vocational education has to make to career development lies not in assigning to or recruiting more students for a vocational education track, but in making vocational education an equal partner with all other activities which constitute the educational enterprise. This means that vocational education courses must be systematically structured to teach not only skills across

families of jobs but to develop within students the elements of career development which will free them to conceptualize the alternative ways in which these skills can be used and to attain the personal competency to capitalize upon skill acquisition. Further, it means that more avenues must be created by which all students can move freely between "academic" and vocational education with the criteria for such movement being individual need, readiness, interest, motivation and the blend of academic and vocational experiences which can meet these criteria. As Moss (1968) has indicated it is "the relative prevocational value of various patterns of preparation that is of prime educational significance." To aid students in patterning and mixing academic and vocational experiences, counselors will need probability as well as multiple discriminant data which compare the characteristics of the student contemplating a particular blend of experience with the characteristics of those individuals who have completed different sequences of experiences and the career outcomes they have attained. Such a procedure cannot be a once and done exercise but rather a complementary and continuing reinforcement of decision-making, value refinement, and personal planning as these occur not only in the selection of pertinent educational experiences but within the experiences themselves.

Higher Education

Although the place of higher education in a unified system or education built around a career development theme has not been made explicit in this paper, it is a necessary corollary to the goals discussed. Post-secondary vocational/technical schools, community and junior colleges, and private institutions providing specific skill training all have a contribution to make to the acquisition by late adolescents and adults of particular types of training. Many of the experiences which they can offer must include the types of experiences and content recommended at earlier educational levels. For some persons, post-secondary education will be the final step of specific skill acquisition before moving into a technician role or a skilled craft. These may be persons who have been exposed to broad prevocational and exploratory experiences before entering post-secondary opportunities. Other persons will seek post-secondary skill training who have not acquired a mastery of more fundamental skills in communications, mathematics, reading, other prerequisites to skill acquisition, or the attitudes necessary to making effective use of skills to be attained. Thus, post-secondary programs, much like secondary programs, will need to begin where the individual is and build in systematic ways the individual experiences necessary to meeting particular interests and goals. Other persons, because of possible displacement by changes in occupational activities, will need retraining or upgrading opportunities and these, too, need to be made available through the several possible combinations of post-secondary education.

In the last analysis, it is necessary that post-secondary vocational experiences be characterized by flexibility and diversity in order that individuals of divergent characteristics can be equipped with skills at the levels and in the fields consonant with their personal needs and the realities of the occupational structure.

Operational Goals Toward Which Exemplary Programs and Projects Might Be Directed

1. Create a system of behavioral objects which reflect career development concepts and which respond to differences in learner characteristics.

2. Determine how content must be structured to include the important concepts to be communicated, the objectives to be realized, the appropriate learning sequence of the material, and the ways by which individual accomplishment of goals can be evaluated.

3. Determine how curricula can be constructed which enable each student to learn about the world of work at higher levels of specificity as he proceeds through school.

4. Determine what current academic experiences are most likely to lead to the specified goals and behavioral outcomes of career development and how their impact on students can be strengthened.

5. Identify strategies by which behavioral goals can be attained through multiple alternatives. Use systems analysis techniques like PERT, PPBS, and CIPP to project the relationships between such areas as career development and curriculum, media and instructional styles, pre-service and in-service education needs of counselors and teachers, the integration of work experience with curriculum, interdisciplinary concepts and occupational clusters, in-school and out-of-school experiences and needed research.

6. Determine the relationships between academic course content and job requirements so that a view of employment and the instrumental value of education can be reinforced throughout the total curriculum

7. Determine strategies by which disadvantaged children can be exposed to the world of work and prescriptions developed by which they can get there.

8. Determine how the concept of continuous education for all segments of the population can be integrated into educational philosophy and into programmatic operations and develop strategies by which students can interrupt their formal schooling without stigma or penalty and with the possibility of return as necessary for consistent up-grading of skills.

9. Determine the efficacy of combining particular educational media with individual learning styles to facilitate acquisition of behavioral goals.

10. Determine strategies by which student interests, readiness, and goals, rather than arbitrary class schedules, can determine access to a wide range of instructional materials -- e.g., films, tapes, records, books, CAI -- in support of determined lines of inquiry related to career development.

11. Determine what kind of community and industrial resources contribute to the attainment of specific career development behavioral goals and under what conditions, for whom and when such referral sources as rehabilitation, youth opportunity centers, the urban league, mental hygiene clinics, tutorial services are feasible.

12. Determine the efficacy and the characteristics of simulated environments, e.g. techniques of gaming, by which students can experience cause-effect relationships and the knowledge that choices have consequences.

13. Determine the characteristics of emerging occupations employing large numbers of women as well as those areas in the technical and health fields, public employment sector, consumer and production services which suffer low visibility as these need attention in occupational information.

14. Determine the relationships which exist between various patterns of academic and vocational education and subsequent performance in job families.

15. Compare on different criteria of career maturity the status of youth who have had work experiences of different kinds with those who lack such experience. Ascertain whether youth with planned work experiences are more responsive to career planning than those who are exposed to simulated experiences.

16. Determine how work experience activities can be integrated with the total school curriculum without impeding student progress toward a number of future goals simultaneously.

17. Identify the characteristics of those students who find success in various vocational education options and the outcomes which they subsequently attain as a result of vocational education.

18. Identify those factors related to restricted socio-economic status which limit the promise of such youth to cope with skill mastery, attitude development, achievement motivation and design experiences which can overcome systematically such deficits.

19. Identify work factors which possess the highest degree of communality, and hence transferability, among and between job families or clusters as a basis for constructing occupational classification systems, improving occupational information, and designing behavioral objectives.

20. Determine how and what types of information contribute to the meeting of particular behavioral objectives and under what conditions it does so.

21. Determine how information retrieval systems can tailor the characteristics of information specific to characteristics of individual learners, the questions about which they are personally concerned, and relative to the specific decisions being made.

22. Design an occupational classification system within an explicitly development framework. Relate occupations to interests, capacities, investment required -- e.g. training and time, differential work roles.

23. Develop occupational information sensitive to the cognitive and affective dimensions of career development as these are related to motivational behaviors, perceptual behavior, attitudes, and predisposing sets found among students of different experiential backgrounds.

24. Test informational materials with different subpopulations in the setting for which they are intended to assess the degree to which they are generally sensitive to the vocational problems of these populations.

25. Examine ways by which training durations and time spent in vocational experiences can be made more flexible to accomodate individual differences.

26. Identify models which reflect patterns of schooling responsive to the needs of women, differently advantaged populations, different learner styles and develop their implications for institutional forms and organizational management of educational experiences.

27. Identify the contributions of specialists at different levels of responsibility -- the practitioner, the preparer, the supervisor -- to the behavioral objectives established for students.

28. Devise, install, pilot test, and evaluate career development programs in natural school and community settings. Create networks of career development demonstration projects which have a resource/demonstration/in-service as well as an evaluation capability.

29. Develop systematic programs to prepare teachers and counselors, both pre-service and in-service, to facilitate career development and to acquire knowledge of and experience in the work world outside the school.

30. Examine the relationships between universities, state education agencies, and local educational systems necessary to the facilitation of a career development theme throughout education.

31. Inventory legal and legislative constraints as well as those restrictions attendent to union membership and access to apprenticeships which may impinge upon the creation of work experiences for large numbers of students, the blending of in-school and out-of-school experiences for particular students, and any proposed dimension of career development. Design strategies by which such constraints can be removed.

32. Identify administrative and political considerations which may inhibit or which are necessary to implement effectively a career development approach within education.

33. Design models by which State Education Agencies can provide impetus to career development at local levels, can tie the objectives of career development to state objectives for education, and can generate activities designed to demonstrate the efficacy of a career development theme pervading education at all levels.

34. Intensify research on early childhood, learning relative to concepts of mastery, coping behavior, achievement motivations, vocational motives, occupational valuing, as these bear upon later vocational planning and adjustment.

35. Intensify research on such questions as Do students think in terms of careers or entry jobs, school subjects and college majors or industries? Is indecisiveness a general behavior pattern or is it restricted to career choice? How wide spread is indecisiveness among student population at different levels and of different characteristics? What are the characteristics which differentiate those who are guided by security from

those who are risk-takers in decision-making? When are career choices made and what influences are most potent in shaping choices? When students do not perform adequately in their field of interest is this a matter of aptitude or of commitment? How can individuals be most effectively assisted to connect their interests and the various career patterns available to them?

Elements of a Model for Promoting Career Development in Elementary and Junior High School

Norman C. Gysbers
Associate Professor of Education
University of Missouri

This paper is divided into two major sections. The first section will examine the current status of career development activities in today's schools, discuss some necessary conditions for learning to place as a basis for establishing model programs, and suggest a sequence of content and activity emphases based on these conditions for a developmental program of career exploration from kindergarten through grade nine. The second section of the paper will provide an annotated listing of selected references which may be helpful to those who have the responsibility of developing exemplary programs of career exploration at the elementary and junior high level.

Current Status of Career Development Programs

The role of work in the life of man has long been of concern to educators. This has been particularly true for personnel in the fields of vocational education and guidance. One aspect of this concern has manifested itself most recently in the increasing research and commentary on the phenomenon of career development and on how these concepts relate to the growth and development of youth. The stimulation for gaining knowledge and insight into this aspect of development has come, in part, from the fact that the work world of today and tomorrow for youth is and will be vastly different from what it was at the turn of the century. The world of work is invisible to many youth of today because of the increasing size of many industrial complexes and because of the increasing specialization found within most business enterprises. Concurrently the longer period of time spent in compulsory education has created an additional barrier to their active participation in work. As a result students' concepts of the industrial and occupational world may be diffuse and distorted. Suffering in varying degrees from occupational illiteracy, many youth find it difficult to make the transition from school to work.

These conditions are known and are well documented. The literature is replete with reference after reference concerning the impact of industrialization and social change on the career development of youth. Numerous references can also be found concerning suggested school based programs and activities (particularly at the secondary school level) to soften the effects of these conditions. Where conducted, such programs have met with varying degrees of success. In summarizing the available research, Hoppock (1967) suggests that these programs tend to increase subsequent job satisfaction, reduce unemployment, and increase the knowledge of students concerning the work world. And yet, even with this positive evidence concerning the possible impact these programs can have, they have not generally become part of the accepted curricula in most of our nation's schools. For whatever the reasons, and there are many, the schools of America have not yet devoted appropriate attention to implementing carefully articulated programs designed to foster the career development of all youth. Unfortunately too, those programs which do exist are frequently "one-shot", cross sectional attempts to handle a developmental process.

Several recent developments, however, offer promise of changing this situation. Much more is known today concerning the factors which influence the career development of youth. Also, recent national concern has focused on the imparative need to foster the total development, including career development, of all youth. A look at the variety of recent national conferences and books on the topic and the number of pieces of Federal legislation which directly or indirectly mention counseling and career development confirms this. Of particular importance for us, of course, is the Vocational Education Amendments of 1968. This bill, through the provisions of Part D--Exemplary Programs and Projects--provides the potential to develop, promote, and evaluate carefully designed and articulated exemplary school based programs to enhance the career development of youth. The present national concern combined with the resources provided by the Vocational Education Amendments of 1968 suggest that the time is now right for action. It also is apparent that vocational education and counseling personnel, working together, are in an excellent position to provide national, state, and local leadership to see that career exploration programs are established, evaluated, and made a part of the curriculum in every school of the country.

The research and commentary on career development make it quite clear that activities designed to enhance one's development in this sphere should begin at the elementary school level. Writers and researchers also agree that these activities must go well beyond only developing job skills

and simply providing occupational information, as valuable as these activities are. It is not enough to supply each elementary school room with copies of the Occupational Outlook Handbook, teach the students some simple manipulative skills with tools, have them visit a local business, and then expect that their career development needs have been fulfilled. Elementary age youth need the opportunity to continuously and systematically explore, from an internal frame of reference, their values, attitudes, aplitudes, and interests in relation to the wide range of educational and career opportunities which may be available to them so that they will avoid premature educational and occupational foreclosure

> The timing for prevocational orientation may be crucial. Once students get involved in the junior high school milieu their own social and physical maturation and the existing organizational structures (both formal and informal) and the rewards offered from these environments in which they live all influence them. They turn their attention to diverse pursuits, such as popularity, prestige, athletic and academic achievement, and appear to develop different life styles, each with a different set of values. If students are helped to focus on career development prior to becoming a part of this milieu, it could help them to build a kind of core attitude toward their personal futures which might provide a slightly different perspective on the many other concerns of this age which are so much a part of growing up. (Sherman, 1967)

Conditions for Learning

To develop sound school based career exploration models at the elementary and junior high levels requires an understanding of the learner and knowledge of how to structure the material to be learned most effectively and efficiently. For purposes of this paper, the learner will be viewed as developing through three learning phases during the elementary and junior high years: percepualization, conceptualization, and generalization. (Wellman, 1967).

The percepualization phase focuses on the processes necessary for an individual to become aware of himself and his environment and to differentiate among them. For example, an early elementary school child is usually able to distinguish between a fireman and a doctor but is probably unable to conceptualize at any depth as to what they do. This usually occurs at the next learning level known as the conceptualization phase. As a child enters this phase he

develops the ability to conceive of the functions of the fireman and doctor. This phase also tends to be more action oriented than the previous phase in the sense that the child begins to use the experiences gained during the perceptual period as a basis for action. He now is able to change perceptions into conceptions. In addition, other behaviors begin to appear. Concept formation is not random but is directional in nature. Based on previous experiences (perceptions) a child begins to value certain things and not to value other things. This is a critical time in career development in that this is when both positive and negative work world stereotypes begin to form. Finally, the next phase (generalization) occurs as an individual is able to cope with cultural and environmental demands, make internal interpretations of environmental transactions, and then generalize these interpretations to other situations. For example, he previously has learned how to conceive of the occupation of fireman and is now able to transfer this conceptualization ability to other occupations.

In broad terms the perceptualization phase could be thought of as occuring during the early elementary years, the conceptualization phase during the later elementary years, and the generalization phase during junior and senior high school (See Figure 1). It is understood, of course, that some individuals may move through these phases more rapidly than others and that the cybernetic effect of feedback may shorten an individual's time of movement through these phases, particularly as he grows in age and experience. Also, once all of these processes are operative, an individual will be using all three at the same time and will continue to develop and refine them as he grows older.

Effective model development also must focus on the nature of the material to be learned in the model, with attention being paid to predisposition, structure, and sequence. (Bruner, 1966). The proposed content must contain something to activate the learner, something to keep him going, and something to keep him from random actions. A consideration of the structure of knowledge to be learned also is necessary. The structure of the knowledge contained in any model may be characterized by the mode of knowledge representation (actions, pictures, and symbols), its economy, and its effective power. The impact of the variables will vary according to the individual, his age (phase of development), and the subject matter under consideration. Finally, model development must concern itself with the sequence in which the knowledge to be gained is arranged. It must be arranged in such a way so as to increase the learner's ability to grasp (perceptualize), transform (conceptualize), and transfer (generalize).

Figure 1

Suggested Content and Activity Emphases in Career Exploration Programs

Grades K - 9

Career Development Profile

In addition to knowledge about the learner and about the organization of the content to be learned as necessary prerequisites for the development of a career development model at the elementary and junior high levels, there needs to be some way of monitoring the progress of an individual's career development and of providing feedback concerning the impact of the model to program administrators. The contents of the profile would provide a longitudinal look at the career development of an individual in terms of his interests, abilities, and values as well as cross sectional checks against group normative data. Also rather than being encased in the traditional manila folder, the contents of the career development profile should be stored on magnetic computer tape ready, at an instants notice, to be flashed on any one of a number of monitors in the school.

Individual Development Versus Manpower Needs

The emphasis of career exploration programs at the elementary and junior high levels should be on the individual development of all individuals rather than on the early selection of some to fill certain occupations. The objectives of career exploration activities should be based on and directed toward filling the needs of individuals rather than on meeting the demands of the labor market. Career exploration programs at this level should not be seen as strictly a mining operation in which only those with certain talents are chosen but as more of a farming approach in which all individuals are provided with opportunities to grow and develop. (Goslin, 1965). Career exploration activities at the elementary and junior high level should be those which broaden and strengthen an individual's base of experiences in those areas which need development as well as building on an individual's areas of strength. In this context and at this level (elementary and junior high), the assumption is made that all students are potential school dropouts and that all are potentially disadvantaged, in varying degrees, with regard to their knowledge and understanding about the work world. This assumption is derived from group generalization type data about the common needs of groups of individuals at the elementary and junior high levels. It is important to recognize, however, that generalizations can and should be made about specific individuals and thay any program must take such generalizations into account. Because of this, the application of instructional experiences should be by prescription--some activities are useful for all individuals to experience while other experiences need to be provided to only certain individuals on

the basis of need.* To do this requires adequate knowledge concerning the nature and characteristics of the population to be served by a given program.

Suggested Emphases for Career Development Programs

For this paper the suggested content emphases of career exploration programs in the elementary and junior high school years will be based on three learning phases (perceptualization, conceptualization, and generalization) suggested previously and which have been hypothesized to occur during these years.

Kindergarten - Grade Three

As indicated in Figure 1, it is suggested that in kindergarten through grade three, career exploration experiences should be provided which will expand the perceptual base of an individual in all aspects of the work world. Beginning in kindergarten, experiences should be provided which focus on helping individuals find out who they are, how they are alike and different from others, and on finding a satisfactory place for themselves in their school and home from which they can relate to others. In grades one, two, and three, the emphasis on the home and school environments should be continued and deepened. Attention should be paid to workers in the home and school. The surrounding community also should be explored in increasing detail with attention being given to the wide variety of occupations and the interrelatedness of these occupations in the working community. The content of these experiences should focus on the nature of work, who works, where people work, and why people work. Such content should be presented through a multimedia approach--literature, visual aids, manipulative activities, field trips, and visitations from a wide variety of occupational role models--in carefully arranged sequences. (Bank, 1969). These experiences should be designed to develop the skills of listening, observing, contrasting, differentiating, thinking, and manipulating to provide a base for the next learning level. The Technology for Children Project, New Jersey State Department of Education, is an example of an experimental program designed to provide exploratory experiences in technology for children beginning in the lower elementary grades. One goal of the program at this level is to help children gain knowledge about themselves and their relationships with people in the work world (perceptual level). The activities in this project

---

*For an example of a career guidance program to meet the needs of urban elementary age youth see pages 372-376 in Guidance for Children in Elementary Schools, by Hill and Luckey, Appleton-Century-Crafts, 1969

include field trips, films, and discussion. A major objective of programs at this level should be to "fund" students with a broad range of perceptual experiences (skills) concerning the work world so that when the conceptual phase occurs, they will be able to base their actions (conceptions) on a wide range of meaningful experiences--they will have the necessary skills to begin to conceptualize the work world and their place in it.

Grade Four - Grade Six

During grades four through six, the content emphases of career explorations experiences should continue the exploration of self in regard to an ever widening range of occupations and perceptions about work, begun in the earlier grades. During this period the content also will become somewhat more abstract. Subtle differences in the meanings that people attach to work not previously noted may now be apparent. For example, they may note that during visits from occupational role models, some role models value certain aspects of work (the associations with fellow workers) while others may emphasize the content of the job itself. Such differences should be discussed. The emphases of program activities at this level also need to change somewhat and become more action oriented. Based on the experiences the students gained in perceiving, differentiating, and contrasting work world phenomena and their relationship to them, knowledge and skills concerning the processes involved in career decision making need increasing emphases. The same type of media used in the early elementary grades should be continued, but in addition, life career gaming and work simulation techniques should be added. These techniques provide the opportunity to take advantage of the increased action orientation found at the conceptualization learning phase by having the students participate by doing. The life career game approach for example, will help an individual focus on and discuss the many variables which may impact on him as he plans his future. Simple work simulation experiences using selected industrial arts type concepts also should be begun at this stage to help students in acquiring the basic necessities of the work world such as effective time organization patterns, good work habits, and cooperation with others. Role playing activities which focus on work situations and the behavior of workers and work groups should be encouraged. For example, the school itself could be used as a work setting (Leonard and Stephens, 1967). The typical duties students perform in the classroom, the principal's office, and around the school grounds could be organized to provide work experiences. Perspective employees (the students) would apply for work, go through job interviews, and perhaps be hired, depending on their

qualifications for the job. If hired they would work under supervision experiencing the same direction they might expect on a regular job. Such experiences, when coupled with group guidance designed to help these students understand and appreciate what it means to work, would add to their ability to conceptualize and generalize work world phenomena.

Grade Seven - Grade Nine

The content emphases of career exploration programs in grades seven through nine should provide increasing emphases on the elements which influence career decisions. Relevant content for students at this level include a study of the purposes and types of educational opportunities which may be available to them; the status of their career planning; a developmental perspective on their self-concept (variations among people due to heredity and environment dimensions of self, self perceptions); knowledge of the wide range of occupations (relationship of personality characteristics to occupations, occupational stereotypes, requirements and opportunities related to current career interests); and the factors involved in career exploration (responsibility for planning and decision making, values and goals in decision making) (Sherman, 1967). The activity emphases in grades seven - nine should continue to be action oriented (career game and simulation type experiences) with particular focus on try-out work experiences. As an example, some try-out activities perhaps could be conducted within an expanded industrial arts type curriculum. Work simulation techniques such as organizing a typical manufacturing company within a class setting and having the students perform the various personal functions involved in selecting, designing, planning, tooling, producing, and marketing a product would be encouraged. Counseling sessions should be an integral part of this and similar activities so that the experiences could be used as a context to explore student values and attitudes--both personal and work related. Opportunities for exploring the wide range of occupations (using the job cluster approach) located in businesses and industries other than manufacturing also would be necessary. Still another activity at this age level, and in the environmental context of the school, are occupational oriented extra curricular interest clubs for purposes of career exploration. Finally Purcel and Klaurens (1968) suggest these additional techniques:

1. When a student learns an operation he is given the opportunity to instruct other students and thereby test and improve his ability to give instructions. This technique also gives the student recognition

and a sense of achievement, stimulating his interest in the further development of skills.

2. When learning new operations, students are shown how these operations contribute to the well-being of society. For example, good carpentry or mechanical work adds to people's comfort, efficiency and safety. Students value their own work and that of others when they perceive its social contribution.

3. When a student shows interest or skill in a particular operation performed in class, he is encouraged to become familiar with the occupations in which the operation is performed. This may be accomplished by having him study job descriptions to identify related occupations or by letting him interview local industrial firms to find out what job opportunities are available for a worker with this skill and interest.

4. Industrial arts classes are organized as work groups with students rotating in the role of foreman. A board of directors might determine what policies and procedures would be established to run the shop (class) efficiently. The students might also develop a procedure for evaluating performance and thereby gain an appreciation for the standards industry requires.

5. Students in industrial arts classes are encouraged to explore surrounding industries. Craftsmen and other workers might be invited to discuss their jobs before the class or specific members of the class might visit selected industries and report to the class of their experiences. (Students should be encouraged to formulate questions to be asked of persons in industry. These questions should be designed to explore the work requirements and job opportunities and to learn about the psychological and sociological dimensions of the work-role relationships, social demands on the workers, satisfactions, degree of independence, and so forth.)

Although these activities listed by Purcel and Klaurens are industrial arts based, similar types of activities could be conducted in other career exploration type classes (introduction to vocations classes, home economics classes, group guidance classes).

The major objective of all of these techniques at this learning level should be to help students effectively generalize (translate and transfer) their perceptions and

conceptions of themselves and their understandings of the work world into reality through meangful career decision making concerning future educational and occupational plans.

Selected Resources

The second part of this paper will provide an annotated listing of references which may be helpful to those who have the responsibility of developing exemplary programs of career exploration at the elementary and junior high level. Unfortunately none of the references to be cited are complete resources by themselves. Each contains portions which may be useful, however, to prospective model builders. Also, the listing is not exhaustive, but will attempt to provide coverage of some promising career exploration program practices in vocational education and counseling.

Journal Articles

1- Cook, H. E., "Vocational Guidance Materials: A Survey for Teachers," American Vocational Journal, 1968, 13, 25-28.

Materials which may be of use to planners of career exploration programs are listed in this article. Of specific interest are the following:

Curriculum Units, Robert L. Frank, University of Northern Iowa, had graduate students in an NDEA Institute develop curriculum units for grades K-12. The attempt is to provide a guide to help classroom teachers relate to the world of work through the ongoing curriculum. "The focus is placed on the human, the personal area of each job, instead of the position itself," Dr. Frank says. Materials include lesson plans, bibliographies, and lists of motion pictures and filmstrips, for all grades. This work is still in the experimental stage; however, the materials show great promise for general use and serve to illustrate the concern that educators have in providing career development materials and processes for all school children.

Countdown to the 70's, a TV series for upper elementary grades, is scheduled for the 1968-69 school year. Initial programs include health careers and careers in education. A teachers guide, vocabulary list, and glossary are among materials used to reinforce telecasts. Children's interest and knowledge, the national and local occupational outlook,

and the availability of training facilities were criteria for selection of the occupational areas to be telecast.

When I Grow Up, a 25-minute operetta by L. Lenski, with music by C. R. Bulla, can be used to advantage in grades K-3. Teachers report that it gives children the opportunity to develop an awareness of the different work-roles, and in some instances, improves their self-concept. One teacher adapts it to her class no matter what its size. Carpenter, nurse, fisherman, clown, soldier, cowboy, and farmer are the occupations portrayed.

2- Hansen, L. S. Theory into practice: a practitioner looks at career guidance in the school curriculum. The Vocational Guidance Quarterly, 1967, 16, 97-103.

A framework for school personnel on which to build career guidance programs is presented in this article. Selected career exploration activities were presented.

3- McDaniels, C. Youth: too young to choose? The Vocational Guidance Quarterly, 1968, 16, 242-249.

The author raises the question about youth being too young to choose. His answer is that youth are not too young and much should be done in the school to encourage career development.

4- Purcel, David J., and Klaurens, M., "The Guidance Objective in Industrial Arts," American Vocational Journal, 1968, 43, 17-18.

This article discusses techniques for integrating career development concepts into the industrial arts program to provide meaningful exploratory experiences for youth. It suggests that industrial arts should provide students with opportunities to (1) evaluate their interests, abilities, values, needs, and other personal characteristics as they relate to occupational roles; (2) explore the psychological meaning of work and its value in the human experience; (3) explore broad occupational areas in terms of opportunities, potential satisfactions, required roles of workers, and other related considerations; (4) develop an awareness that the individual's role in work is tied to the well-being of the community; (5) exhibit planning ability in striving to achieve occupational goals and objectives; and (6) develop the concept that they are productive persons in a work-centered society. To accomplish this, the article suggests a number of techniques which could be used to help students appraise themselves and the world around them.

5- Smith, E. D., "Innovative Ideas in Vocational Guidance," American Vocational Journal, 1968, 13, 19-22.

The author summarizes a number of programs which have implications for career explorations programs. Among them are:

Career Development Activities for Grades 5, 6, and 7. Abington School District, Abington, Pennsylvania; Elmore E. Pogar, Director

The guidance department of this southeastern Pennsylvania school district initiated a project designed to develop learning experiences and guidance techniques in the area of career choice which could be implemented through the existing curriculum and guidance program.

Working from the assumption that the school is a potent force for the student in terms of his untimate choice of a career, they designed activities that would provide meaningful learning experiences for the student and at the same time focus on some of the heretofore nebulous aspects of the career choice process.

After a review of the literature in the area of career development, three themes (interest, change, values) were selected and one was assigned to each grade level, as follows:

Grade 5: How Our interest Developed and Their Importance in Our Lives.
Grade 6: Changes That Are Taking Place, Decisions Which Are Made, and How They Affect Our Lives.
Grade 7: Our Values--How They Influence Our Decisions and Our Lives.

The themes provided the focus for the activities of each grade but were not necessarily a limiting activities (a card game, an interest inventory, a two-act play, a simulated panel discussion, tapes, skits and roleplaying situations) were developed for each theme.

Perhaps the most striking feature of this endeavor was the ability of the project personnel to identity a specific need--a viable program of activities in the vocational aspects of guidance for children in the intermediate grades--then successfully bridge the gap between research and the application of research findings. The active student involvement and the joint efforts by teachers and counselors are other significant features of the Abington project.

Project PACE (Preparing, Aspiring, Career Exploration), Dayton City School District; William H. Goff, Director.

The PACE Project was implemented during the 1966-67 school year to determine if measureable increments in occupational choice could be achieved in predetermined situations at three grade levels in two elementary schools with socio-economically different student populations. A secondary purpose of this project was to develop, for future elementary-school counselors, a role model having a developmental framework instead of a problem-centered orientation.

The program plan was developed by two counselors for the three grade levels (second, fourth and sixth) in each of the elementary schools. All available resource materials were assembled and a teaching outline was written prior to the beginning of the more formal aspects of classroom work.

The instructional plan for each school and each grade level was implemented in three different ways in an effort to determine the effectiveness of the various approaches. The research design called for three experimental groups and one control group. The measured effectiveness of each group--the teacher-only group, the counselor-only group and the teacher-counselor group--was then analyzed.

Project PACE was continued for a second year on an experimental basis. After thr thorough evaluation now underway is completed, a curriculum guide of activities designed to enhance the vocational awareness of students will be prepared for use by teachers and counselors in the elementary schools of Dayton.

Books

1- Adams, J. F. (Ed.), Understanding adolescence. Boston: Allyn and Bacon, Inc. 1968.

This book contains several excellent papers on adolescense including a chapter by Henry Borow on "The Adolescent in a World of Work."

2- Amos, W. E. and Grambs, J. D. (Ed.), Counseling the Disadvantaged Youth. Englewood Cliffs, New Jersey: Prentice-Hall, Inc. 1968.

A number of excellent papers are contained in this volume. Several in particular focus on the relationship of disadvantaged youth to the work world.

3- Gilbert, H. G., Children study American Industry. Dubuque, Iowa: William C. Brown Company, 1966.

The purpose of this resource book is to aid elementary school teachers in directing learning activities that involve the tools, machines, materials, and processes of industry.

4- Hill, G. E. and Luckey, E. B., Guidance for Children in Elementary Schools. New York: Appleton-Century-Crafts, 1969.

Chapter 10 in this book is an excellent source for concepts and ideas concerning career exploration programs in elementary schools. An excellent bibliography of related books and resource materials completes the chapter.

5- Norris, W., Occupational Information in the Elementary School. Chicago: Science Research Associated, 1963.

This book contains lists, books and pamphlets, films, recordings, poems, and songs which can be used in the elementary grades. Suggested lesson plans also are provided.

6- Scobey, M. M., Teaching Children About Technology. Bloomington, Illinois: McKnight and McKnight, 1968.

Part I of this book presents a philosophical background concerning the field of industrial arts. Part II examines the characteristics of American industry. This examination is organized in terms of human activities. Part III offers suggestions to help a teacher provide curriculum related experiences.

7- Tennyson, W. W., Soldahl, T. A., and Mueller, C., The Teacher's Role in Career Development. Washington, D. C. National Vocational Guidance Association, 1965.

This booklet is addressed to teachers as a guide to their work in developing and teaching units on the world of work.

ED 016268
Barbula, P. M., Isaac, Stephen W. Career Simulation for Adolescent Pupils. Final Report.
San Diego County Dept. of Education, California.

The purpose of this study was to assess student acquisition of knowledge about vocations after participation in a career simulation game and to determine attitudinal change toward vocational concepts. Data was collected through a pre-test and a post-test. A sample of sixth- and eight-grade students was drawn for the treatment and the control groups.

The treatment groups participated in the career simulation game while the control groups received the usual curriculum program. No statistically significant differences were found between the groups on a 10-item questionnaire on vocational insightfulness. A general trend to increase hours of study on the post-tests was evident for the treatment groups, although no statistically significant patterns were found. The negative results may be due to insenitive instrumentation. The investigators believe that further developmental work is indicated to explore simulation as a method of teaching career development principles to adolescents.

ED 012 934
Goff, William and others. Project P.A.C.E. (Preparing, Aspiring, Career Exploration).
Dayton City School District, Ohio.

Certified school counselors were assigned to two elementary schools to develop, use and test vocational and occupational materials. Aspiration levels of students in one class each in the second, fourth, and sixth grades in each school were also explored and related to occupational potential. Methods of using occupational materials effectively were also tested, pre- and post-tests were given to assess pupil knowledge of occupations. Achievement and ability measures were obtained early in the school year. Questionnaires were given to teachers and parents of children in the experimental groups. Some findings were--(1) the students assimilated vocational and occupational information, (2) older elementary students exhibited greater vocational awareness, (3) changes in level of aspiration as a function of learning potential were not differentiated between the experimental and control groups, (4) the Dictionary of Occupational Titles was used successfully by the counselor and older elementary student, and (5) parents and teachers were enthusiastic about the program.

Krumboltz, John D. Vocational Problem-Solving Experiences for Stimulating Career Exploration and Interest, Phase II. Mid-Project Report, December 1, 1966-April 30, 1967.
Stanford University, California School of Education.

New occupational career kits are designed to provide realistic occupational experiences in the fields of appliance repair, law enforcement work, and electronics. The work involved in developing and testing each kit is delineated. The two major experiments designed to test hypotheses about the optimal use of these kits are described. The first experiment investigates the effect of occupational simulation materials of three levels of difficulty on students

of three levels of ability and differing occupational interests. For the second experiment, specific ways were tested of tailoring occupational problem-solving materials to the preferences and interests of the individuals.

ED 015 517
Krumboltz, John D. and others
Vocational Problem-Solving Experiences for Stimulating Career Exploration and Interest. Final Report. Stanford University, California, School of Education.

To motivate interest in career exploration, five sets of job simulation materials were developed and tested for accounting, X-ray technology, medical laboratory technology, sales, and banking. Each "Career Kit" presented problems representative of each occupation and the background information needed to guarantee that most subjuect could solve them. Hypotheses comparing problem-solving approaches with alternative approaches were tested in three studies. It was concluded that--(1) problem-solving "Career Kits" consistently produced more interest and more occupational information seeking than control treatments, and (2) subjects from lower socio-economic schools consistently gave more positive reactions than subjects from middle-class schools, particularly in response to the problem-solving materials.

Leonard, George E.
Developmental Career Guidance in Action, the First Year. Wayne State University, Detroit, Michigan

The Developmental Career Guidance in Action (DCGA) project sought to (1) broaden and raise the educational-occupational levels of aspiration of a selected group of Detroit inner-city public school students, (2) develop a pilot program to better meet their needs through emphasis of developmental educational-occupation career guidance in grades one through 12, and (3) to involve the staffs of the participating schools in the program through cooperative planning and development. In phase 1, 40 representatives from the schools met with resource personnel to discuss economic and social trends, visited industry, colleges, and community agencies, discussed ways of improving education, and developed plans for program improvement. In phase 2, a three-person team was placed in each school to work with the school staff, the community, and the students to carry out a program meeting program objectives. Results indicate that the level of student aspiration increased. Students showed more growth in regard to occupational knowledge and planning, re-examined their value structure, showed a more acceptable attitude toward counselors, and perceived

a greater need for professional help. The project was evaluated by Dr. Charles Morris who concluded that the idea and strategy for implementation of DCGA had made "a significant contribution to the young people in the project schools."

Morrison, Edward J., Lecznar, William B.
Development and Evaluation of an Experimental Curriculum for the New Quincy (Mass.) Vocational-Technical School, the Sequencing of Learning Units. Seventh Quarterly Technical Report.
American Institute for Research in Behavioral Sciences
Report No. BR-5-0009
Public Date 31 Dec. 1966

The principal goal of project able is to Demonstrate the increased effectiveness of instruction where the content is derived from an analysis of desired behavior after graduation. It also attempts to apply newly developed educational technology to the design, conduct, and evaluation of vocational education. This report considers the problem of selecting sequences for learning units so that students acquire the desired performance capabilities systematically and efficiently. Section one reviews a plan which allows students to qualify for successively higher-level jobs and provides a series of points at which students may leave the curriculum in accordance with their capabilities and needs. Section two discusses an analytic procedure for deriving learning structures, first described by R. M. Gagne. It provides an analysis of the kinds of performance capabilities which must be acquired, rather than an analysis of subject-matter logic. Section three reviews the major factors affecting a sequence through the exercise of available sequence options and by the addition, repetition, and deletion of units from the sequence. The final section of the report concerns empirical test and revision of the initial sequence design.

Norris, Eleanor L. Sherman, Vivian S.
Source Data on Perceptions of Parents and Children Regarding Career Planning. Planning and Develoment of Research Programs in Selected areas of Vocational Education, Volume II.
American Institute for Research in Behavioral Sciences.

Responses to a questionnaire developed to gather data on plans, attitudes, interests, and aspirations of students and parents relevant to career planning were presented. The questionnaire was administered to 404 boys and girls (grades 6, 8, 10, and 12) and their parents. The gathered

data were compared to show the influence of parents on their children's career thinking and the agreement and disagreement between parents and children on a number of items related to vocational planning. High agreement was found between parents and children on questions dealing with the need or desire for parental help and involvement. Conversely, low agreement was found on several items which required concrete information about the child's career and educational plans and about attributes of the child which suit him for a particular occupation. There was also little agreement about persons and events which influence the child in his career thinking. The implications of attitudes of parents and children toward some educational-vocational related concepts were discussed.

ED 010 626
Guidance Curriculum for Increased Self-Understanding and Motivation for Career Planning. Planning and Development of Research Programs in Selected Areas of Vocational Education Volume III, Appendix
By Shermen, Vivian S.
American Institute for Reaserch in Behavioral Sciences

Experimental meterials that were developed for the vocational guidance of junior high school students were presented in this appendix to ED 010 625. These materials were planned to enable students to thoroughly and systematically explore their own self-perceptions, attitudes, personal values, achievement, abilities, and diverse career possibilities. Development of the materials was guided by the hope that they would enable the students to emerge from learning experiences with clearer conceptions of who they are and where they are going. Sample student work sheets, questionnaires, and reading and writing materials were included for all lessons. The questionnaire responses of approximately 100 boys and girls (grades 6, 8, 10 and 12) were presented in graph form to allow students using these study materials to look at the career plans and attitudes of a sample of their peers while simultaneously viewing and evaluating their own. Although developed for use with junior high school students, the author suggested the materials were also suitable for use by students in the upper elementary grades or at the senior high school level. Included with the materials were teaching guidelines and evaluation sheets for a recommended followup evaluation of the empirical effects of the curriculum materials. Related reports are ED 010 623 through ED 010 625

ED 020 554
Sherman, Vivian S.
Trial and Testing of an Experimental Guidance Curriculum. Final Report.

American Institute for Research in Behavioral Sciences

Innovative vocational guidance curriculum materials were designed to increase self-understanding and motivation relative to career exploration and planning. These materials stemmed originally from a survey of attitudes and planning relative to career development in the Palo Alto Unified School District. The research data was used as curriculum content, focusing upon the self as a crucial variable in career motivation. Detailed background on the material is given in Section I. Section II describes the setting, design, methods employed for teacher orientation, instruments, scoring procedures, rater reliability for handlingsubjective data, testing procedures and problems, and method of analysis. Though some statistically significant results emerged as evidence that the curriculum experience did have some desired effects, certain limitations lead to the conclusion that, in effect, the materials in their present form have not been adequately tested. Other finding, such as sex differences and some grade interactions, tended to suggest directions for curriculum innovation, educational practices, and further research. These are discussed in detail in connection with each significant variable in Section III. Section IV includes a brief overview of the statistical results and their implications for educational practices and curriculum development, specific consideration of the instruments used, and general research recommendations.

ED 012 939
Varenhorst, Barbara
Information Regarding the Use of Information Regarding the Use of the Life Career Game in the Palo Alto Unified School District Guidance Program

A program to teach decision-making skills to ninth and 11th grade students using local research data, visual aids, and other materials was undertaken. In group guidance sessions, these problems were discovered--(1) some decisions are never consciously made, (2) the emotional bases of decisions are not considered, (3) many students avoid making decisions because they fear lasting consequences, and (4) provisions for practice in decision-making are needed. To alleviate some of these problems, the life career game developed by Boocock and Coleman, was employed. Using two groups comprised of 10 and 18 students respectively, teams of two students were formed. Each team planned a fictitious student's life for 20 years, including education, occupation, family life and leisure time. Teams competed for the highest number of points in the game. The games were successful because they provided motivation and involvement, illustrated future factual realities, and led to discussion.

Since the game meets some needs which were lacking in group guidance sessions, it can be used in conjunction with the sessions. Plans call for its extended use in the high schools as well as implementation in junior high schools.

ED 014 119
Wilson, Eugene H.
A Task Oriented Course in Decision-Making. Information System for Vocational Decisions, Project Report Number 7. Harvard University, Cambridge, Mass.

A course in decision-making, built around the Tiedemen-O'Hara Paradigm, was taught at a junior high school to test materials. The three essential aspects of teaching decision-making are--(1) learning the language of the decision-making process, (2) practicing decision-making while under supervision, and (3) formulating criteria for a decision. A booklet, "You, the Decider," containing relevant theory, activities, tasks, and cases resulting in explicit criteria for choice was given to students. Weekly workshops for teachers were held six weeks before the course began. A sharing of competencies by research personnel, counselors, and teachers took place at the workshops, which were continued through four weeks of actual teaching. Resource materials included the "Occupational Outlook Handbook" andKatz's "You, Today and Tomorrow." Results of the evaluation of the course are not presented, although a definite research program has been designed. A copy of "You, the Decider" and various evaluation instruments are included.

Computer Based Systems

TITLE: Development of a System of Vocational Exploration through the use of the Dictionary of Occupation Titles (Third Edition) and the Ohio Vocational Interest Survey

INVESTIGATORS: Ayres D'Costa, David W. Winefordner, John G. Odgers

LOCATION: Division of Guidance and Testing, Ohio Department of Education, 751 Northwest Boulevard, Columbus, Ohio 43212

FUNDING: Ohio Department of Education and Harcourt, Brace and World, Inc.

COOPERATING AGENCIES: Harcourt, Brace & World, Inc.; Division of Vocational Education, Ohio Department of Education; and selected Ohio and Florida schools.

WORKING PAPERS: Yes

PROJECT FORMULATION DATE: January, 1966

COMPLETION DATE: December, 1968

OBJECTIVES: To provide a system for vocational exploration and work orientation based upon the Dictionary of Occupational Titles (Third Edition) and the Ohio Vocational Interest Survey. More specifically to: - enable students to use the D. O. T. in a practical vocational decision making process; - provide indexes of strength and clarity of interests in the areas of the world of work as defined by the Cubistic Model of Vocational Interests and the Ohio Vocational Interest Survey; - provide a framework for orienting students to clusters of jobs with similar involvement of data, people, things and other job characteristics such as interests, temperaments, and aptitudes as provided by the D. O. T.; and - to enable students to achieve a useful level of self-insight in relation to the basic elements of the world of work-data, people and things.

AREA AND USERS: Nationally for grades 8 through 12.

TITLE: Project PLAN

INVESTIGATOR: John C. Flanagan

LOCATION: American Institutes for Research, Palo Alto, Calif.

FUNDING: Westinghouse Learning Corporation, American Institutes for Research, U. S. Office of Education, cooperating school systems.

WORKING PAPERS: Yes

PROJECT FORMULATION DATE: 1967

COMPLETION DATE: 1970

OBJECTIVES: To create a modular individualized computer assisted program for learning in accordance with needs.

The Guidance and Individual Planning Division of Project PLAN has a responsibility for orienting students to Project PLAN, its philosophy and system of operation, to inform the child regarding the world of work, leisure and citizenship, to help him in his formulation of his educational, vocational and life goals, to ascertain and counsel with him regarding the nature of his developed abilities and the implications of those abilities for his chosen goals, to assist him in the

development of plans to attain those goals and in the acquisition of skills in self-management so that he might be more independent in the pursuit of those plans and to assist him in the continual reappraisal of the goals he has set for himself in the light of the progress patterns he is manifesting.

AREA AND USERS: Elementary and Secondary Schools

TITLE: The Communication in Guidance project

INVESTIGATOR: Ann M. Martin

LOCATION: Indiana State University, Terre Haute, Indiana

FUNDING: U. S. Office of Education through 1967.

COOPERATING AGENCIES: Indiana State University, New York State Education Department, Bureau of Research, and cooperating school districts.

WORKING PAPERS ABAILABLE: Yes

PROJECT FORMULATION DATE: 1966

COMPLETION DATE: Work is ongoing but materials are available now.

OBJECTIVES: The development of a multi-media educational method to motivate students to understand and think about themselves and how to cope with their educational, and later, work problems and environment. Specifically: to communicate guidance concepts to students through image and sound in a manner that stimulates students to relate the elements in the communication to their own existing personal knowledge and experience; to stimulate and reinforce an awareness in the student of a rational and logical course of action to enable him to achieve a beneficial and satisgying adult and work life; to increase the oral language ability of students, their ability to learn about their environment through verbal exchange and interchange, and their ability to engage in prolonged verbal contact with others to establish their own point of view; and to increase the student's ability to integrate other points of view that differ from his own into his thinking about himself, his educational and later work problems and environment. Motivational audiovisual "slice of life" material will be presented via the appropriate media, e.g., 16mm film. Upon presentation of the "slice of life" film, each student discusses, preferable before the group his reaction to the elements

of the audiovisual stimulus materials as it relates to his own experience. The verbal exchange and interchange is guided by the instructor to include those guidance concepts presented by the "slice of life" film. A manual and guide for professionals will include easily understood discussion of the guidance concepts presented by the elements of the "slice of life" material and the kinds of responses to be expected from the students. The student will tape record his discussion and remarks so that at a leter date he may review his original responses and compare them on an objective basis with the responses of other individualy in the group, or his own response made at a later period in time to the same or similar stimulating media. Further objective evaluation will be obtained by administering a written evaluation to each individual the items of which are directed to measure specific behavioral elements stimulated in the individual by the audiovisual presentations. Supplementary materials for students and teachers will be developed.

AREA AND USERS: Secondary schools throughout the country.

TITLE: Rochester Career Guidance Project (A Multi-medium Support System for Career and Educational Planning)

INVESTIGATOR: David B. Youst

LOCATION: Rochester City Schools, 13 Fitzhugh Street South, Rochester, New York, 14614 Phone (716) 454-5360

FUNDING: New York State Education Department Bureau of Guidance; Eastmen Kodak Co. - Research Laboratory; New York State Employment Service; and Rochester City Schools

COOPERATING AGENCIES: All of the above plus Industrial Management Council, Junior Chamber of Commerce, and Rochester Council of Scientific Societies

WORKING PAPERS AVAILABLE: Yes

PROJECT FORMULATION DATE: September, 1967

COMPLETION DATE: June, 1969

OBJECTIVES: To allow and encourage access to currently available Career Guidance information; to develop new materials in visual and auditory form and to provide role models; to develop a systematic approach to Career Guidance in schools.

Project has developed a microfilm file and has computer managed data files. Also has produced visual studies of people in careers and in cooperating in the development of a multi-occupations laboratory which combines an information center with an experience center using "real" equipment and tools.

RECENT PUBLICATIONS: Burnham, R., Johnson, D., and Youst, D., Youst, David B., "The Rochester Career Guidance Project." Educational Technology, March, 1969. Some applications of educational media in a multi-medium support system for educational and career planning in Walter Lifton (Ed.), Educating for Tomorrow: The Role of Media, Schools, & Society. Wiley (In press). APGA Detroit Convention Abstracts, 1968.

AREA AND USERS: As meterials become available the Rochester City School System, the N.Y.S. Employment Service in Rochester, and local employers will be the prime users. However, almost all materials will have broad applications. A new Junior High School is the target population for field testing during the 1968-69 school year.

OCCUPATIONAL GUIDANCE, COUNSELING, AND JOB PLACEMENT FOR JUNIOR HIGH AND SECONDARY SCHOOL YOUTH

Gene Bottoms
Associate State Director
Division of Vocational Education
Georgia State Department of Education

Kenneth B. Matheny
Georgia State College

For large numbers of American youth the public school system represents a maze of meaningless activity leading nowhere. They fail to see any relationship between their current school experience and some identifiable next step beyond school. Such a view is especially common to the large percent who do not continue on to higher education. It is the position of this paper that education at any level should be evaluated in terms of the extent to which students are prepared for, and are assisted in taking, the next step. While it may be argued that the liberalizing effects of an academy education is the best possible preparation in a period where rapid change is the order of the day, nevertheless, it is all too clear to work-bound youth that there is little direct relationship between such preparation and the next step for them; ergo, the high drop-out rate and the lethargic complacency of large numbers of failing youth.

The complexities of modern society have rendered obsolete the socialization process through which many individuals in the past move from childhood to the world of work. The prolonged period of dependency required of today's youth by certification requirements and union regulations exacebates the feeling of uselessness and alienation which many experience as a result of their school experiences. Many youth have limited contacts with work role models from which they might pattern their behavior and aspirations. With the passing of the guilds farm work, or small businesses within the home the sight of formal work has become farther and farther removed from the lives of modern youth. Perhaps the school is the single most appropriate agency for systematically exposing youth to broad vistas of the world of work. It is contended that such a systematic effort offers a promising tack for bridging what many youth see as a "credibility gap" between the announced purposes and the actual purposes of public education.

Since work is the next step for nearly 60 percent of the nation's youth, this transition is too important to be left to "chance." Activities provided by the school to facilitate the student's transition to the next step must be more than a simple matching of student with employer. Each student must be assisted in gaining those skills, attitudes, and understandings which will aid him in locating the most appropriate job. The school must assume responsibility for assisting a student in the clarification of his goals; providing him with knowledge about the labor market; helping him in evaluating his qualifications and abilities in terms of job opportunities; assisting him in developing the flexibility needed for adjusting to a fluctuating society; and, for many students, special assistance in adjusting to and retaining a job. Assisting each individual in making the best possible transition will require a total school effort on a fully organized basis. The focus in this paper will be on the development of systematic and sequential guidance experiences for junior and senior high school students with primary emphasis on non-college bound students. Focusing on these students was not to deny the need for improving the guidance program for other youth. Rather, our intent was to take a narrow focus in order to gain greater perspective regarding ways of meeting needs of these youth. The need for such a narrowing of focus was indicated by Congress in Section 141 (Exemplary Programs and Projects) of Vocational Education Amendments of 1968. "The Congress finds that it is necessary to reduce the continuing seriously high level of youth unemployment by developing means for giving the same kind of attention as is now given to the college preparation needs of those young persons who go on to college, to the job preparation needs of two out of three of these young persons who end their education at or before completion of the secondary level, too many of whom face long and bitter months of job hunting or marginal work after leaving school."

This paper will be developed by first presenting certain general principles which must be considered in the guidance needs of students and secondly, by presenting a capsule description of different models for assisting these youth.

GENERAL PRINCIPLES

First, the guidance point of view must permeate the total school environment. Guidance must not be viewed as a function performed within the confines of the counselor's office. Rather it must be viewed as a vital force permeating the environment, valued and nourished by the entire school staff. Anything short of a total school committment is likely to prove inadequate in providing meaningful, individualized experiences for students with varying interests and abilities. The further recruitment of counselors unaccustomed and ill-equipped to enlist the total school and community in the guidance effort is likely to prove disappointing.

The goals of guidance are sufficiently broad and expansive to preclude their accomplishment by any single worker however well trained. Such goals frequently include: (a) helping the student to view himself as a worthwhile person; (b) assisting the student to experience success in his own eyes; (c) assisting the school in providing meaningful experiences for all students; (d) helping the student to consider, understand, and either accept or reject the values of a work oriented society; (e) assisting the student to develop an understanding and appreciation of his own talents and interests; (f) helping the student to make appropriate choices from the widest possible range of alternatives available; (g) helping the student to formulate plans for implementing decisions which he has made and, (h) helping the student to accept personal responsibility for such decisions. Any casual persual of such goals suggests the absolute necessity of enlisting the active support of personnel both within and without the school for their attainment. The herculean nature of the task is further compounded by the sagging self-concepts of slum children, the limited range of experiences, work and otherwise, available to minority groups and students in rural areas, and the increasingly crowded conditions within urban schools.

Secondly, a greater use must be made of simulated or direct work experiences as a means of assisting students to "experience" work roles. Traditional, vicarious, approaches via printed material, audio-visual aids, etc., are of themselves inadequate. Once the student has a work "experience" it will be much easier for him to assess the suitability of such a work role for himself. From this base of experience the student could more easily predict the suitability of jobs which offer similar satisfactions, and from this understanding, he could identify the type of education needed to obtain a particular job.

Third, a merger of the concrete simulated or direct work experiences provided in vocational and practical arts education with the process techniques of counseling offers a strategy for improving the students' self-understanding. It cannot be assumed that such experiences will be automatically internalized and contribute to a more adequate perception of oneself in terms of the world of work. Not only do youth need appropriate information and experiences, but attention must also be given to the individual's capacity to receive, process, and use information in an insightful manner. Too often counselors have failed to realize the frame of reference such experiences provide students as a basis for meaningful counseling. Guidance and vocational education must be merged if the full value of such experiences is to be realized by the student. A team approach involving the counselor and other teachers, partiularly the industrial arts teacher and the work experience co-ordinator, offers great potential for enhancing the career development of students. While the emphasis of this paper is upon vocational experiences, it should not be overlooked that students

also need many other varieties of life experiences. Seen in this broader context, the work of the counselor involves prescribing experience of various kinds, expediting their availability, and helping the student to derive personal meaning from them.

School counselors must develop strategies for making use of school and community resources in promoting the career development of students. The counselor's role must include the roles of a catalyst, organizer, and coordinator of all those resources that could be brought to bear upon the career development of youth. Too often, however, the traditional training of counselors has focused so narrowly upon the one-to-one relationships as to neglect knowledges and skills for utilizing school and community resources.

Fifth, experiences to promote career development for youth must be sequentially organized. Such an effort cannot be a one-shot approach that takes place at the junior high level. It is too late when the student reaches the point of making the transition from school to work. Career development should be conceived of as a pyramid offering a broad base of exploratory experiences at the elementary and junior high school levels and gradually narrowing to a decision point as the student approaches his next step beyond school. Assistance provided the work-bound youth must be as highly developed as that provided the college-bound since immediate alternatives available to work-bound youth are perhaps broader and more complex. Furthermore, assistance must be extended to such youth beyond the point at which they leave the school (Wrenn, 1962). Many youngsters will need special assistance in maintaining their employment while others will need special assistance in moving up the career ladder beyond the dead-end entry level jobs.

Sixth, school experiences must become more meaningful to students. The curriculum must be psychologically organized as well as logically organized, i.e. subject matter fields must be viewed horizontally with respect to other subject matter areas so as to promote meaningful generalizations. One approach would be to structure much of the curriculum around career development as a theme. There are many other experiences, such as recreational or social, that could also be called upon to promote student motivation.

Seventh, counselors need more of the training of vocational educators, and vocational educators need more of the training of counselors. Vocational guidance in the schools suffers because school counselors possessing interpersonal skills lack first hand knowledge of the world of work and vocational teachers with first hand knowledge of the world of work lack interpersonal skills. The missing dimension so often in vocational education is sophisticated guidance skills helpful in enabling students to personalize their work experiences.

The current training of counselors, on the other hand, places too little stress on first hand work experience. Before counselors prescribe work exploration for students, they, themselves, should seek to broaden their knowledge of the world of work. Unfortunately, either the student selection process or the "press" of the training program tends to produce counselor education students who devalue the importance of work experience. One way around this dilemma might be a common core of training to be provided some counselors and vocational teachers.

GUIDANCE MODELS

Students in junior and senior high schools are in what Super (1963) has referred to as the Exploratory Stage. Vocatinnal exploratory behavior refers "to activities, mental or physical, undertaken with the more or less conscious purpose of hope of eliciting information about oneself or one's environment, or of unifying or arriving at a basis for a conclusion or hypothesis which will aid one in choosing, preparing for, entering, adjusting to, or progressing in an occupation" (Jordan, 1963, p.59). Super breaks the exploratory stage into three substages: (a) tentative, (b) transition, and (c) trial. During the tentative substage the individual is expected to begin to formulate ideas as to fields and levels of work which are appropriate for himself and occupational concepts which will enable him, if necessary, to make tentative choices, that is, to commit himself to a type of education or training which will lead him toward some partially specified occupation (Super, 1963, p.82). The transition substage is one of specification of a vocational preference. The individual is expected to convert a generalized choice into a specific choice and to make a final committment by embarking upon the trial substage through specialized educational and training programs or by taking a beginning job designed to serve as an entry to a chosen field (Super, 1963, p.82). The trial substage is the implementation of a vocational preference. It is at this substage that the individual makes the transition from general education to specialized education or training, from school or college to employment, and is expected to convert his specified vocational preference into a reality(Super, 1963, p.83).

The objectives of the school should be to assist all youth to move successfully through the exploratory stage to enter what is considered to be an appropriate field of work for them. In order to better understand those strategies which the school might need to employ in order to insure that <u>all</u> students will move smoothly through the exploratory stage and into the gainful employment one should be reminded that the duration of each substage is dependent upon the point at which the student leaves the school. (see Illustration I): Whereas, the strategy most typically employed by the school was designed for,

and is appropriate to, the needs of college-bound students, the school has almost entirely overlooked the differing needs of early school leavers. Since the substages of the Exploration Stage are greatly compressed for such students, the school cannot afford the leisurely pace with which it typically moves students through these experiences.

Furthermore, the achievement level of many of these students terminating at high school graduation is from two to four grade levels under their actual grade placement. They experience grave difficulties in a school setting where most learning experiences are of an abstract nature, and thus they have little motivation for traditional school learning. Most of the extra curricular activities of the school are not designed for these students. Too often the school, with its emphasis on the abstract learning task, deferred gratifications, and middle class extra curricular activities, has failed to provide for these students a setting in which they might acquire a positive identity and some sense of control over their destinies. Moreover, such youth are forced to retreat from the school to find meaning.

For terminal students the school must provide a structured sequence of activities designed to move these students through the substages more rapidly in order to gain greater perspective, suggested models will be examined at each of the following levels: junior high (7,8, and9); middle high school (9, 10, and 11); upper high school (11 and 12).

Junior High School Level (grades 7, 8, and 9)

The junior high school should provide activities and experiences which would enhance greatly both the quality and scope of self-understanding in relation to the world of work. While the increasing complexities of modern living suggest the desirability of the school strengthening its holding power upon early school leavers, the school should recognize that in spite of all of its efforts, some students will leave prematurely. For such students the school must devise strategies for compressing experiences normally offered students over a period of several years into a one or two year period. Thus the experiences provided the terminal student at this level must include the acquisition of the basic habits of industry and the assistance needed to enter and adjust to some type of job. For the college-bound youth, the intent of the program at this level is not to force the student to commit himself to an educational and occupational choice, but rather to acquire the basis upon which future educational and occupational decisions can be made. For other continuing students, the intent becomes one of assisting them to move into the transition substage so that they can explore a particular area in greater depth. In other words, the program enables the student to

narrow down his next step. For example, for some students this might include distinguishing between business curriculum, industrial arts or agriculture. Well planned experiences for such youth can contribute significantly to the students regarding the following six dimensions of career development:

(1) Evaluating Self-Characteristics: Experiences provided students would include those designed to assist them in evaluating their interests, abilities, values, and needs as they relate to occupational roles.

(2) Exploring Broad Occupational Areas: Students would be assisted in seeing the broad array of occupations available and the potential satisfaction of different work roles.

(3) Appreciating the economic and social values of work: Students would be assisted in recognizing the economic and social values that different forms of work have in our society.

(4) Appreciating the psychological and sociological meaning of work: Students would be instructed in the personal and social significance of work. They would see work as a way of adding meaning to the lives of most persons and as a way of gaining many social rewards.

(5) Recognizing appropriate educational avenues: Students would be helped to see the relationship between educational avenues and career opportunities.

(6) Practicing decision making skills: Students would be instructed in the proper manner of making decisions. Opportunities for decision making with group review should be provided. Students would be shown how to locate available resources.

The following are examples of different models for accomplishing the above mentioned guidance goals at the junior high school level for both terminal and continuing students.

I. Program of Education and Career Exploration (PECE)

A program of education and career exploration (PECE) is to be initiated in the fall of 1969 in twenty Georgia High Schools. One may note some similarity between this model and the old occupational course. However, Hoyt (1969) identified several factors contributing to the demise of such past efforts which include: (a) an approach that only provided experiences of a vicarious nature and a telling-teaching technique; (b) lack of teacher preparation: (c) lack of clear understanding regarding expected outcomes; (d) lack of commitment regarding the importance of the course; and (e) inadequate materials. In this model several steps are being taken to avaid making the same mistakes. Some of these follow.

The content and activities of the TECE program are to be organized around work roles. Using Roe's (1956) occupational classification system, occupations will be divided into six categories of interest which are to some extent arranged in a continum from an oreintation of working with people to working with things. The six major occupational groupings are: (a) service (b) business (c) organizational (d) expressing ideas (e) outdoors (f) technology.

Secondly, students will be provided an opportunity for simulated or direct work experience in each of the six occupational groupings. this way students will gain first-hand knowledge of the world of work; they will experience the smells, sounds, and sights of the working environment as well as the pride that comes from a finished product. How much better this experiential learning is outdated form of the printed page! From this base of experience it will be much easier for students to predict their own suitability for similar types of jobs and more easily.

Thirdly, after students have experience a particular work role in one of the six areas, organized group sessions will follow the purpose of assisting them in examining that particular work role in terms of the six different dimensions of career development. The six different dimensions as has been shown earlier include:

(1) Self-understanding
(2) Decision making
(3) Other related work roles
(4) Educational avenues
(5) Psychological and sociological meaning of work
(6) Economic and social values of work

Such group sessions would enable students to focus on questions such as: How did I feel about myself while involved in the work role? What are other jobs in our society that might provide similar satisfaction? What are the different decisions one would have to make in order to enter a particular job? What value does the work role under question have economically as well as socially to our society? What educatinnal avenues could prepare one for a particular job? The actual experience of participating in a work role would offer a springboard from which a student could assess himself in relation to the dimensions of career development. This process would be repeated each time the student experienced a work role. Such an approach enables the content of such a course to be integrated around a particular work role. It offers a vehicle for integrating the different dimensions of career development around a core of concrete experiences rather than the traditional approach of taking each dimension of career development as a separate entity within itself. Thus is does provide for a spiral of ever-increasing understanding of the self in relation to work.

Fourthly, seven educational television programs will be prepared and shown statewide at three different periods of time for the purpose of supplementing this program. Each program will deal with one of the occupational groupings previously identified. They will show examples of jobs at various levels within these groupings. These films will be purposefully structured to communicate certain concepts and understandings to students. For each of the seven films there will be six follow-up group guidance units, one for each of the six different dimensions of career development.

Fifthly, the well developed interpersonal skills of counselors as well as a keen understanding of the world of work are direly needed for the success of this program. To insure that coordinators will have a minimum of these skills and understandings, they will be required to attend a nine week, summer training session that well simulate those experiences to be required of students during the following year. It is not at all presently clear just what the eventual training program of such persons should be. A concerted effort will be made to identify those skills, knowledges, and understandings which prove most helpful, and recommendations will be offered to training instititions.

II The Full-time Counselor Who Conducts and Coordinates an Exploratory Program in Grades 7, 8, and 9

In this model the counselor utilizes both personal contact with students and environmental manipulation for the purpose of promoting the career development of youth. Not only would the counselor organize a systematic and developmental program of individual and gourp activities with students in grades 7, 8, and 9, but he would also serve as a catalyst, organizer, and coordinator in planning a systematic and developmental program of activities utilizing teachers, the curriculum, peer groups, clubs, and community resources for the purpose of promoting career development. This program would need to be planned in such a way that the activities of all those involved are being directed toward common goals. Maximizing the use of direct and indirect approaches for promoting career development may require counselor education programs to place as much emphasis on environmental strategies as is now being placed on one-to-one counseling. This model was developed as part of the national conference held during the summer of 1969 at West Gerogia College.

It was suggested at the conference that the data, people, thing conceptual framework (D.O.T., 1965) as the basis for students relating themselves to the world of work. The conference identified both knowledge and behavioral objectives for six dimensions of career development: self-understanding, work, educational avenues, economic and social value of work, decision making, and employability skills.

Activities for accomplishing each objective were identified at the 7th, 8th, and 9th grade levels. Thus, at each level the student would gain greater insight. The activities were further subdivided into those to be performed by the counselors and those activities to be performed by others.

The influence of the counselor could be multiplied many times through effective use of community and school environmental resources. Such an approach may serve to make the entire educational program meaningful for students. This approach enables the counselor to pull from the special resources that are possessed within the school and community. Furthermore, it provides flexibility in dealing with the different subpopulation within the school. (David Winefordner, 1968).

IV. Using Existing Vocational Programs for Providing Exploratory Experiences

The intent of this model is to utilize the existing vocational curriculum as a medium for providing students with exploratory experiences prior to their entrance into a particular vocational curriculum. Such experiences might be provided logically at the 7th or 8th grade levels.

In order to implement this model, a close working relationship must be initiated between the counselor and vocational teachers to insure appropriate planning and scheduling. The program should be divided into three phases: PhaseI, the orientation phase, would be conducted by the counselor and would last for approximately 10 hours. A number of vicarious experiences would be used to facilitate the student's quest of self-understanding and to intooduce him to broad areas of the world of work. In Phase II, the exploration phase, the student would rotate through each of the occupational areas and perform certain tasks for reality testing. The student will spend between 5 - 10 hours in each vocational area offered by the Phase III conducted simultaneously with Phase II, offers follow-up counseling services after each vocational experience. The student would be assisted in deciphering the meaning of his personal responses to his vocational experiences in terms of a "Goodness of Fit" test. Furthermore, he would assist in gaining additional vocational knowledge regarding occupational areas through a variety of vicarious activities.

Forsyth Program

The Forsyth Program currently conducted in Forsyth County, Georgia is similar to the Richmond Plan (1962). It represents an attempt to reconstruct the total educational environment to render it meaningful to socio-economically disadvantaged students. Such youth appear unready to benefit from the schools' abstract curricula. Furthermore, many of these youth, for a lack of adequate worker models,

have developed basic attitudes of indifference toward work. The Forsyth Plan was designed to get to these two factors. The concrete elements of a particular vocational program such as industrial arts, home economics, or agriculture is used as the core around which the basic academic curriculum (math, science and communication skills) is centered. Students are placed in work stations either within the school or outside the school, and the experiences obtained by the student within the work setting and those enountered within the school are used as the basis for daily group counseling sessions. The group counseling sessions are conducted by an Educational and Work Experience Coordinator who also places and supervises students in their work stations and coordinates the activities of those teachers assigned to work with students enrolled in the project.

The major focus of the Forsyth Program has been upon grades 7, 8, and 9. The State of Georgia plans to initiate ten such pilot programs for the coming year. A special training program containing elements from vocational education, general education, and counselor education would appear necessary for training the Education and Work Experience Coordinator. (Bottoms and Reynolds, 1969).

Middle High School (Grades 9, 10, 11)

Grades 9, 10, and 11 represent the highest concentration of school exodus prior to high school graduation. The school during these grades should provide appropriate opportunities for allowing students to explore in greater depth those areas of interest for the purpose of enabling students to convert a generalized choice into a specific choice. The school must provide the range of experiences and activities necessary to aid students in the clarification and further differentiation of an area so that a specific choice can be made. This exposure should be at such depth that students are exposed to the content, tools, settings, products, or services of a particular occupational field as well as to the range of opprotunities available to enable students to further differentiate choices available within the area. The experiences provided during this level should be designed to further increase student's understandings regarding the six different dimensions of career development previously identified.

For the college-bound youth the transition substage may extend itself through two to four years of college. For students considering post-secondary vocational-technical education they may remain in the transition substage until their senior year of high school. For the continuing students who may terminate their education upon the completion of high school, the transition substage should provide an opprotunity to explore in greater depth occupational areas that they feel might be more appropriate for them. Such programs sould enable students to acquire a clearer perception of themselves in different

work roles within an occupational grouping and enable them to select a specialized education or training program for employment upon completion of high school. The experiences provided during the transition substage for terminal students should be of such depth that they acquire certain elementary skills that would make them employable at some level.

I. Maximizing the Use of Industr al Arts in Career Development

It is proposed that the induatrial arts curriculum provide a vehicle, a frame of reference, a base of experience through which students are able to gain greater self-understanding in relation to manufacturing occupations provided they are given an opprotunity for appropriate reflection. The industrial arts curriculum is diversified and offers a variety of experiences in an organized laboratory. Students are provided with basic exploratory experiences in using many of the tools, materials, processes, and products of major industries. Thus the nature of the industrial arts curriculum offering is such that it provides an opportunity for students to try themselves out in a variety of simulated work roles. To maximize the use of such experiences of career development,time must be provided for the student to examine the experience in terms of the several dimensions of career development. This could be accomplished through a team approach involving the counselor and industrial arts teacher. To implement this model would require the identification of acitivities to be performed by the counselor for the industrial arts teacher as well as specific follow-up activities the counselor will perform with students must be spelled out. The contact with role models and working environments should prove especially helpful to youth handicapped by their attitudes toward work as a result of unfortunate models presented by their parents.

Upper High School (Grades 11 and 12)

Students who terminate their education upon completion of high school must be provided with the assistance necessary for making a successful implementation of their vocational preference. The fact that one objective is to continue to reduce the proportion of students who leave the secondary school for work rather than continuing post-secondary education does not lessen the need for an appropriate job placement program for terminal students regardless of the point of departure from school - be it at high school graduation, before, or after.

Guidance programs for non-college-bound youth should primarily be concerned with assisting the student to make a satisfactory transition from school to work or to a post high school training program. There are two primary objectives of a job poacement program: First,

of appropriate attitudes and skills for making a successful transition to the world of work; and second, the development of a placement service whereby students and employers are brought together. The first objective is one to which the total school must contribute. The effort must begin upon the student's entrance into the school. The point at which the student makes the transition from school to work is often too late for the school to substantially contribute to this objective.

The second objective, development of a vehicle,should be attacked with the same degree of intensity with which counselors help place students in college. Accomplishment of this objective could result in appropriate changes within the school to better acoomplish the first objective. Imagine the effect of having 25 employers entering a school to intreview students for jobs. Would this not suggest to students that the school is the best place to be in our society in order to get a job? Would it not help teachers to better appreciate the non-college-bound students? Would it not couse teachers and administrators to review the appropriateness of much of the school's program for the neglected majority? The entire secondary school program is typically geared to college-bound youth. This can be clearly seen in the following practices of the school:

First, the students have been reminded onstantly that mastering certain curriculum experiences is necessary in order to get into college. Why can't the same relationship be built between the school and work? Would this not be meaningful to the terminal student?

Secondly, the counselor usually has an in-depth knowledge about the college their students are most likely to attend, and they spend many hours assisting students to study the pros and cons of different colleges. Would not the same be required in order for a counselor to do an effective job in assisting students in making the transition from school to work? The counselor must have similar knowledge of businesses and industries which the students may enter, and he must assist them in examining the pros and cons of each in relationship to the student's abilities and interests.

Thirdly, volumes of college catalogues are available which provide information on entrance procedures, requirements and options available within the college, etc. Why not develop profiles of major businesses and industries within a given region to provide the student with detailed information about entrance requirements, slariess, and procedures for job offered by these concerns. Through the years, we have ha occupational information. Most have recognized its limited usefulness of current occupational information in helping students make specific decisions about their entrance into the world of work. When compared to the college materials, it falls far short of

assisting youth in making detailed plans for job entrance. The SOS models developed by Hoyt (1966) offer an excellent example of ways in which such information on businesses and industry can be collected.

Fourth, college-bound students are assisted in making every decision involved in entering college: completing the application form, taking the College Boards, being interviewed by the college admissions officer, etc. Should we not also provide the student who plans to enter work with such needed assistance? Surely we can determine ways of providing work-bound students with such detailed assistance. They are probably more in need of it than the college-bound since the maze of business and industrial oppurtunities available today must appear extremely fuzzy when viewed from the perspective youth who have never been in the world of work.

To assume that a single high school counselor can develop and implement a full-fledged job placement program without some outside resources and assistance is but a dream. There must be some central staff or agency which cuts across two or more schools that could provide supportive services needed to enable a given school to implement an effective job placement program. It may be possible for the employment service to play a major role here. In most instances, they have not seen fit to perform such a role.

For those youth who plan to continue their education in a post-secondary institition the 11th and 12th grade should continue to assist them in deciding upon a specific choice to pursue. Unlike colleges, post-secondary vocational-technical schools require the student to have a firm choice upon entrance.

Three models for upper high school are presented: job placement, remedial experiences for those who reach the implementation phase without appropriate background, and a model dealing with articulation between secondary and post-secondary vocational-technical schools.

I. A Model for Entry Job Placement and Follow Through For a Single School or Multiple Schools

The job placement models are based on the belief that the school has the responsibility for assisting each youth in preparing and successfully implementing his plans for the post school years. It is essential that the school accept this repoonsibility for the work-bound youth with the same vigor and energy it has exhibited for the college-bound youth. Just think what it might mean to a group of students to know in reality that the school is the mest place to be in order to get a job! It seems that there is no better way of illustrating this than to assist each student to obtaining appropriate employment.

The implementation of a job placement and follow-through program within a single school may be impossible within the existing framework and resources of most schools. To do so would require reorganization of the thinking of the currently employed staff to become oriented to job placement of the students in their charge. It is suggested that a cooperative job placement strategy be initiated, one in which teachers and guidance specialists share in the responsibilities for providing an organized and systematic job placement program. The teachers provide experiences and activities designed to enable students to develop attitudes needed to enter and adjust to the work world, while the guidance specialist coordinates the total job placement effort, provides teachers with resources and consultative assistance, and provides the student with counseling and other assistance as needed. Three sequential steps are suggested for the job placement program: first, preparation for entrance into the world of work which includes assessments of one's own desires, abilities, etc., and the acquisition of knowledge about occupations and what is expected of a person in a work setting. Second, locating and accepting a job which includes making plans for moving from school to work and in implementing plans as well as contacting potential employers. Third, follow through personal contact and counseling for students once they are placed on a job to assist them in retaining the job in establishing plans for moving up the job ladder. The third step is seen as being significant for many students, particularly for the culturally deprived, for not only do they need assistance in obtaining a job but they also need assistance in retaining the job.

The model for a job placement service for a multiple system that might cut across several systems differs from the model for a single only in that a central coordinator and resource office would be established. The functions performed by such an office would have as their major purpose increasing the potential of local school staffs to adequately conduct an effective job placement program with responsibility for job placement remaining within the school. This office would function as a service and resource center to the surrounding schools for the purposes of (a) gathering and disseminating information about job openings, (b) conducting broad job promotions, (c) doing job clearance, (d) conducting follow-up and evaluation studies, and (e) providing in-service training for staff development. The staff for such a central office could be under the direction of a board of education or under the department of labor. The model is based on the belief that it is virtually impossible for a single school to employ the staff necessary to acquire resources necessary for an effective placement program. This concept has considerable merit for rural areas because several school systems could be served

by a central office. (Georgia has an example of a statewide job placement system for post-secondary vocational-technical schools; also Cleveland, Ohio, has a city wide job placement program.)

II. Learning, Earning Educational Program LEEP

One of the major problems confronting education is the need to develop a remedial approach to serve those youth who separate themselves from school without the necessary skills for obtaining and maintaining a job. The LEEP program was initiated in Georgia as a short-term program for those youth:

--who have been conditioned by ten to twelve years of failure in a public education system;

--who have been confronted with educational experiences which seem irrelevant in terms of the kind of world in which he finds himself;

--who have been conditioned to believe that only certain types of work are worthwhile, and that the kind of work which he seems destined is not within the acceptable categories;

--who have been led to believe that they really can't learn and that they really have no control over their destiny; and

--who have been exposed for the most part to inadequate work models.

There are many such youth in our society today who reach the point of transition from school to work without appropriate behavioral patterns. For these students, job placement cannot end upon placement in a job. Such students will need continuous support and counseling for a period of time to develop the behavior patterns necessary for adjusting to a job. With such a continuous contact with students, it is possible for the counselor to assist them in seeing the possible career ladders existing in the area in which he is employed, and to foresee how he could plan to re-enter appropriate educational avenues to move up the career ladder. As long as 35 per cent of our youth never complete high school in this country, concentrated programs at the point of transition will be a must.

There are, no doubt, many approaches for assisting such youth. I would like to describe one briefly. A short-term

program has been iniated in four post-secondary area vocational-technical schools in Georgia. A counselor-type has been employed as the LEEP coordinator with responsibility for the recruitment of students, for providing group counseling, for coordinating other phases of the educational programs, and for locating, placing, and maintaining students on the job. The educational phase lasts for eight weeks and consists of three aspects: (a) basic education, (b) group counseling and (c) general vocational training in a career area. Two hours a day is devoted to each phase. This program has as its motto, "nobody fails". During the first week students are assisted in establishing goals capable of being achieved within an hour, thus providing for immediate success. The program stresses the building of confidence through a cariety of approaches. At the end of eight weeks students are placed in entry-level jobs or enroll in the on-going vocational program. The key to the success of the program is the coordinator. He must have strong commitments and concerns for these individuals. Seventy-five percent of these students enroll only after one or more personal contact by the coordinator.

Georgia initiated four such pilot programs this past fall and plans to extend the number to ten for the coming year. This addition will enable us to serve approximately 600 individuals next year at a cost of less than $300 per enrollee. In the four pilot programs this year, over 80 percent have completed the program and over 80 percent of those placed in jobs are still working. Several decided to attend school full-time. The LEEP program represents an excellent example of how counselors can be deployed in new ways to attack the problems of select groups.

III. Establishing Formalized Procedures for Entering Post-Secondary Vocational-Technical Schools

Vocational educators must devise means through which students can make and implement long-range plans for enrolling in a vocational school or program just as other students are able to do for college. Slocum and Bowler (1967) found that students were far more certain of their desire to obtain vocational education than they were about making specific plans for reaching this goal. Could the above disparity result in part from the failure of vocational educators to devise and advertise procedures through which students can enroll in vocational-technical programs? A few years ago I was confronted by a group of high school counselors who charged that it was easier for a student to enroll in college than in a

vocational-technical school. This incident clearly indicated to me the importance of formalized procedures for entrance into vocational-technical programs. Vocational programs at both the secondary and post-secondary levels should develop admission procedures that enable the high school counselor to provide potential vocational students with the same assistance in planning for their next step as he now provides the college-bound. For example, the post-secondary vocational school that processes applications in October for acceptance in September is more likely to encourage students to make concrete plans for the vocational schools early than are those schools which become concerned about September enrollments in August. Such a procedure enables prospective students to approach the vocational school with more pride in their vocational choices (Bottoms, 1968).

The Educational Testing Service and College Entrance Examination Board and developing and validating a test battery that can be used to predict student success in the different offerings of the vocational-technical schools. College-bound high school students have available to them more predictive information in regard to their chances of success in college than do their counterparts who plan to enroll in technical programs. Secondary school counselors and guidance personnel in technical schools have been handicapped by a lack of information concerning reliable predictors of success in vocational-technical schools. When this test battery is completed, local vocational schools could have it administered in the high schools in a manner similar to the manner in which the College Board is presently administered. While some high school students were prepared to take the College Board, others would prepare to take the Vocational-Technical Boards.

Summary

The schools must not neglect the need of work-bound students for proper guidance any longer. It must organize its responsibility for offering an interesting, meaningful, and useful set of experiences for all students. Furthermore, it must accept the responsibility for helping all students to take the next step beyond high school in the smoothest possible manner. Work-bound students have been groosly neglected by guidance personnel. More adequate guidance programs will involve: (1) efforts to render the curriculum more meaningful; (2) the arranging of work (and perhaps other types of) experiences

accompanied by group counseling sessions whereby students are better enable to understand themselves through experencing work roles; and (3) the provision of job placement services and continued counseling to enable the new worker to maintain his employment and set reasonable goals for career development. Several models for delivering such services were suggested in this paper.

WORK-EXPERIENCE EDUCATIONAL PROGRAMS FOR SECONDARY YOUTH

George W. Burchill, Ed. D.

National Conference on Exemplary
Programs and Projects
(1968 Amendments to Vocational Education Act)
Atlanta, Georgia
March 12-14, 1969

WORK EXPERIENCE EDUCATIONAL PROGRAMS FOR SECONDARY YOUTH

Americans, despite the evidence of sometimes marked turmoil in our society during recent years, share many common values and concerns. One of these values is the importance of educating the young. Social, economic, and racial differences notwithstanding, we unite in recognizing the importance of providing educational opportunities and experiences for our children. While the goal of providing educational opportunities for youth is a universally recognized one, agreement on the equally important objective of providing young people with appropriate educational experiences, which will insure their development into competent, productive adulthood, is attained only with great difficulty. Views regarding this goal's achievement vary as much as individuals differ one from another. Educators are not exempt from the dilemma. Agreement in identifying experiences and in accepting strategies necessary to implement the learning derived from the experiences is perhaps more difficult to attain from educators than it is from any other group. We recognize only that opportunities must be provided and that these opportunities must be as diverse as are individuals. The abundance of psychological research in recent years into human development and learning differences concentrates different perspectives on little more than the common acceptance of the need for variety.

In directing concern to the difficulties of providing educational opportunities and experiences for young people, it is necessary first of all to recognize the population. Who do we educate in our American system of education? Limiting attention to the junior and senior high school age groups, general categories can be noted: the small "academically able" youth, the very large "middle group", the "educably handicapped" classification, and, finally, the group that has received such national attention in recent years--the "alienated" young people. Without attempting to define with precision the differences that exist between these major groupings, it is appropriate to consider some of the educational experiences that all of these students require in their growth toward adulthood in today's world.

The attainment of adulthood is not an easy one in Space-Age American society. Fifty years ago in this country, youth achieved adulthood via the path to work. Boys prepared for vocations in a primarily agricultural society. Girls

prepared for the work of homemaker, motherhood and, many times, co-worker on the family farm. In such a setting, the sequence of steps toward these goals was recognizeable. Young people progressed as they achieved the developmental levels toward independence and maturity identified by Havighurst as necessary to adult adjustment. Also identifeable were the psychological career development stages researched by Super and others. Youth attained maturity as they moved from childhood fantasy through vocational reality testing and on to the vocational maintenance stage in the community and work structure of their era. How much more complex is today's world for young people! In a growing urban society, beset with the advantages and ills that evolve from industrial, technological and knowledge expansion, adolescents develop in a fluid society. The acquisition and development of an adequate self-concept is not an easy task for today's teenagers--witness their appeals for assistance reflected in rebellion, drug experimentation and law defiance.

Adult society, although slow in reacting at times, is becoming increasingly cognizant of youth's plight. Unfortunately, initial concern was in many instances prompted by the "acting out" of young people. During the last decade the rate of delinquency among the country's youth has increased alarmingly. In 1957, the number of juvenile delinquency court cases was double that reported in 1948. More than 600,000 juvenile offenses were serious enough to require court action. They involved approximately half a million individual young people, or almost 2.3 per cent of all children living in the United States in the ten-to-seventeen-year age group.[1] In the decade that has passed, delinquency has increased even more. There is hardly a community in the United States that does not admit its concern for youth's adjustment problems in their striving for adulthood. Juvenile delinquency is one of the United States most unnecessary problems. Society has provided neither the opportunities nor the experiences required for youth to achieve adulthood in socially acceptable ways. Moreover, it is not just a reflection of urban ills. Despite its reputation as an affliction of the metropolis, delinquency is far from contained within the city limits.

Delinquency and the larger problem of youths' dilemma in a world they do not understand, and which does not understand them, has caught the attention of numerous individuals interested in the psychological development of young people.

---

1. R. L. Pertman, "Delinquency Prevention", Juvenile Delinquency, Facts and Facets, No. 4, Government Printing Office, Washington D.C., p. 3.

The phenomenan of human behavior is a fasceinating and elusive study. Continued evaluation of findings in light of changing environments and eras is mandatory. Researchers such as Erikson and Havighurst have for some years concerned themselves with adolescents' developmental patterns. Their findings indicate that much of the personality development of youth evolves through their psychological adjustment to the developmental tasks imposed upon them by society. As distorted patterns evolve in the lives of certain individuals, anti-social reactions may result. The development of the self-concept, especially during adolescent years is crucial. The reconciliation of youths' actual self-concept with the ideal vision of adulthood is difficult in a society such as ours. In addition to the pressures of society, Havighurst points out "the turmoil and conflict which accompany the adolescents crisis is further complicated by the task of achieving emotional independence of parents and other adults, making it difficult for the adolescent to rely on these older sources for guidance".[2]

All of youths' "acting out" is not delinquent behavior. Instead, as Erikson believes, adults brand as delinquent some behavior youth exhibit as they experiment with role development. Such reality testing may be very necessary for some adolescents. Unfortunately, during the process, many young people are classified by a society which is caught in the paradox of attempting to maintain order while at the same time attempting to develop perspective toward youths' adjustment stages. The response toward young people that society must adopt is a constructive attitude toward the development of our progeny and the utilization of its own resources to enable them to achieve worthy adulthood. Such a positive and constructive approach can do much to enhance the successful development of individual youth and the society.

One of the avenues being utilized to aid youngsters achieve adequate self-concepts and accomplish the developmental tasks of growth is work-education. A blend of work and study in the formal education experience of high school age students may enable young people to achieve adjustment during their adolescent development. Curriculums based on academic preparation and supervised work experience can do much to satisfy a student's need for recognition. In work study settings, they can develop feelings of individuality in roles which are satisfying to them, both in the present

---

2. R. J. Havighurst, Developmental Tasks and Education, University of Chicago Press, Chicago, 1948, p. 242.

and in the future adult stations they may occupy in life. Identification with meaningful work can provide youth with the means of recognizing their individual maturity along with its responsibilities.

Various work-experience approaches exist in secondary schools in the United States. The majority of these programs are designed for the non-delinquent student. More specialized programs developed for the handicapped and the identified delinquent exist in smaller numbers. With the thesis that work education can be incorporated into the school experience of junior and senior high school students from any of the classifications noted previously, i.e. the academically elite, the average student, the educably handicapped youth and the alienated youngster, it is well to review the salient characteristics of some exemplary work-education programs researched a few years ago under a Ford Foundation grant to Phi Delta Kappa and reported in the publication, Work Study Programs for Alienated Youth: A Casebook:

Example I

SECONDARY WORK-EXPERIENCE EDUCATION PROGRAM
Santa Barbara, California

The work-education program in the city high schools of Santa Barbara is designed to give students an opportunity to try out jobs. It is a distinctive program--well organized and broad in scope.

The secondary work-education program in the Santa Barbara city schools developed from the Santa Barbara County High School Program which was started in February, 1953 to provide vocational counseling help, job placement, and work experience for the senior high school students in the co-operating schools. The needs of youth were studied by a citizens committee composed of school administrators, counselors, teachers, and private citizens. They concluded that schools should make curricular provisions to help students bridge the gap between school and work. Furthermore, they concluded that the transition of youngsters from school to work could be successful only with the co-operation of the schools, parents, students, and community residents.

A philosophy, developed by the committee to guide the establishment and development of the work-education program, stated the project's purpose: to give young people the opportunity to discover their vocational

interests while doing actual work in business, industry, and the professions. The program is also intended to help students to make better occupational choices, to gain the necessary prepartion for their chosen work, to find placement on the job, and to adjust and grow on the job.

The work-experience program, school-sponsored as part of the regular curriculum has three distinct parts: exploratory work-experience education, general work-experience education, and vocational work-experience education.

The exploratory work-experience education phase includes work done on school time. The program is designed to offer high school students an introduction to the world of work, permitting them to explore their vocational interests and discover their aptitudes through a variety of part-time jobs in industry, business, or the professions. Students are supervised by school personnel and receive school credits toward graducation, though they do not receive any pay.

The general work-experience education phase is intended to give students experience in bona fide work settings where they meet regular work standards. They work for pay and school credits, during or after school hours, on part-time jobs supervised by school authorities. Their job assignments, however, do not have to be related specifically to the careers for which they are preparing.

The vocational work-experience education phase is set up to provide students paid jobs in the field directly related to the occupation they want to enter after they leave school. It is a laboratory experience for them while they are still enrolled in school.

Each student's assignment in the program is made on the basis of a number of criteria: the student's personal desire, the coordinator's evaluation of the appropriateness of a particular work station, the parents' approval, and state regulations.

The participants range from boys and girls of sixteen years of age to college students in their early twenties. The largest group includes high school juniors and seniors. The program does not specify that pupils exhibit special characteristics other than those required

under the California Administrative Code (i.e. A pupil must have attained junior standing in high school or sixteen years of age, except those with specific authorization by the principal. Pupils with exceptional need who are fifteen years of age may be enrolled. Students must be enrolled as full-time pupils).

The administration of the program requires a close working relationship between school, state employment services, and employers. The school district employs a co-ordinator to supervise the over-all program. In addition, a full-time school co-ordinator is assigned to each of the three city high schools. He and his staff of counselors and teachers oversee the placement of students, supervises on their work stations, co-ordinates their activities with parents and employers, and reports on the progress of each student. The number of staff personnel assigned to the program varies with each school. Staff members are chosen because of their interest in the program and their ability to work with students, parents, and employers. Specific professional qualifications are not a requirement for appointment.

At all schools, monthly staff meetings are held to keep the personnel up to date on the progress of the total program. Individual school co-ordinators hold frequent district meetings to share information and to co-ordinate activities to insure a program of maximum flexibility.

The program has been evaluated thoroughly, both by outside evaluators and district personnel. Studies have been conducted by representatives from the School of Education, University of California, Los Angeles and by a Santa Barbara Youth Conference Planning Committee. The latter group concluded their evaluation of the program in positive terms:

The program has value:

To the students. Working in the adult world has given students a new feeling of "belonging". Being given responsibilities has in turn made the student accept those responsibilities in a more mature way. The young person who has "tried out" in a variety of work situations is more able to choose the career for which he is best suited and in which he can contribute the most as a citizen. The work-education program has resulted in bringing youth and adults closely together in a way that has not been possible before.

To the community. This organized approach to work-education has been received with great favor by the citizens of Santa Barbara County. Young people have demonstrated that they can be relied upon for really important work. Giving them such meaningful activity as part of the community has meant that they are less likely to get into trouble.

To the schools. The close association of school and business that resulted from work-education--school supervision, conferences between school personnel and employers and between students and co-ordinators, and work evaluation--all help the schools become aware of needed changes in the curriculum to prepare young people for the demands of the working world. The work-education program is one of the best ways for the schools to learn about rapid changes and advances in work methods and to revise educational programs in accordance with these advances.

To the future of the country. The great scientific and technical advances in the United States today have brought about the age of automation--an age in which every worker must be a specialist. Young people who have been trained in work education during their high school days will be more able to make effective contributions to the adult world when their school days are over.[3]

Example II

PREVOCATIONAL SERVICES FOR HANDICAPPED YOUTH
Champaign, Illinois

Another phase of education is necessary for those who are potentially maladjusted because of physical or mental handicaps. A program for this type of younster has flourised in Champaign. In a complete special education program within the public schools, rehabilitation is accomplished through a prevocational curriculum designed to offer the educational, vocational, and psychological support these boys and girls need to make a satisfactory transition from school to work.

---

3. G. W. Burchill, Work Study Programs for Alienated Youth: A Casebook, Science Research Associates, Chicago, 1962, pp. 54-61.

Handicapped youngsters are enrolled in small, special classes where they are instructed by teachers trained to work with socially maladjusted children. In sheltered class environments, youngsters are helped to understand themselves and their social responsibilities. Those who make the social adjustment are placed on part-time work assignments in school and are supervised by school personnel. Work assignments and classwork are co-ordinated to help students appreciate the value of work and understand their obligations to others.

Children succeeding in the first stage are released from school for half-day job assignments in the community. Their adjustment is helped by co-ordinated efforts of employers, program supervisors, state rehabilitation counselors, school social workers, and special teachers.

Students who perform adequately on part-time jobs receive help from school personnel in finding regular employment when they leave school. Their successful transition from school to work is enhanced by regular follow-up visits.

The prevocational services for handicapped youth program has been developed from this philosophy:

> All youth, regardless of their intellectual, physical, social, or emotional status, need the best possible prevocational education and services to assure adequate vocational adjustment. Even more careful planning must be carried on and more intensive services must be provided the handicapped to assist them in developing their potential and in making the transition from the school to full-time employment in the community. If the school does not accept its full share of the responsibility for helping the handicapped develop the attitudes, habits, and skills necessary for good vocational adjustment; modify problems that may interfere with adequate vocational adjustment of the handicapped; and, if definite plans are not made and services not rendered to help the handicapped bridge the gap between school and full-time job placement, the handicapped are going to continue to drop out of school early and to be among the unemployed.
>
> The unemployment of the handicapped is an intolerable waste of human resources; it contributes

to a mounting financial burden to society; a fertile breeding ground for fostering the development of antisocial behavior may be the result. It is part of our cultural heritage that persons must be gainfully employed to be accepted into our society.

Prevocational education of the handicapped becomes a responsibility of the schools the first day the child enrolls. We in the Champaign school system contend that it cannot be postponed until he reaches adolescence. Prevocational education involves all those experiences which foster the acquisition of desirable attitudes, habits, skills, and knowledge necessary for effective vocational adjustment. It is an extension of, as well as an integral part of, the special services program.

From this philosophy the department of special education identified their initial objectives to be:

Development of policies and procedures to facilitate a close working relationship between the school and the Division of Vocational Rehabilitation to help handicapped pupils bridge the gap between the school and further training and/or full-time job placement in the community

Utilization of community resources that can contribute to the vocational development of the handicapped

Improvement of the prevocational curriculum for the handicapped

Formulation of a five-year plan for follow-up of handicapped youth after they leave school

Establishment of a committee to supervise the project, made up of representatives from the Illinois Division of Vocational Rehabilitation, the Champaign School Board, and the Champaign school staff

The Champaign system provides a developmental work-experience program in three categories: in-school work experience, part-time work in the community (the work-study program), and full-time employment.

In the primary grades, learning experiences in the

special classes are designed to foster the development of socially acceptable personal habits, attitudes, skills, and work habits communsurate with the capabilities of each youngster. Typical goals are: perseverance until a task is completed, efficient use of time, ability to follow directions, and ability to work both independently and with a group.

As children progress through the special education curriculum, some become identified as needing professional help to ready themselves for employment. Others not in special classes may need similar services. All such pupils are referred to the prevocational co-ordinator or the vocational counselor. Any staff person may originate such a referral.

Any child identified by school authorities as handicapped is eligible for the work-study program. Once a child has been identified, the prevocational staff oversees his case. A conference is arranged to review the appropriateness of the referral and to determine the best way to help the child.

Pupils accepted in the program undergo complete diagnostic study including medical, psychological, educational, and social appraisal. Each child's characteristics are evaluated for his placement in the work-study program and for assignment of appropriate staff members to work with him.

Handicapped pupils who can profit from work experiences outside of the special classroom are considered for assignment to the in-school work program. Levels of maturity, specific vocational assets, and personal needs are the criteria used to determine a child's readiness for such a task. Age is not a primary consideration. Some children enter the program at the age of ten, whereas others may not be ready to participate until they are teen-agers. Flexibility is stressed, beginning with the child's first assignment.

Work experience gives handicapped pupils opportunity to transfer habits and attitudes acquired in special classes to extra-classroom work situations within the school setting. Exploratory work experiences--taks performed near the students' special-class teachers--give handicapped pupils opportunities to expand their horizons and still maintain close ties with a person who can understand and help them. In this way pupils receive closer guidance and supervision than they would be likely to receive while

employed on community jobs. In this phase the prevocational co-ordinator works closely with pupils and teachers to become well acquainted with each child, so that subsequent work experiences can be planned.

In-school work assignments include: cafeteria helper, one hour a day; vending machine maintenance, one hour a week; and custodian helper, one hour a day.

When a child is assigned a school task, the child becomes the responsibility of a school employee. This person is to provide a meaningful work experience for the pupil. The staff member plays an important role in helping handicapped youth develop behavior traits necessary for successful vocational adjustment. Stressed are traits such as punctuality, acceptance of authority, acceptable personal appearance, constructive use of time, proper use and care of tools, equipment, and materials, orderly completion of tasks, and an appreciation of the value of work. Work experiences of the child and procedures used in handling him are similar to the experiences and supervision he will encounter on a job in the community. Since the in-school work is a part of the total education of youngsters involved, children do not receive any pay, though school credit is granted.

In addition to his work with individual pupils, the co-ordinator meets with groups of handicapped children in weekly group guidance sessions. These conferences help the children gain better understanding of employers' expectations. Information is imparted through group discussions, role playing, and the use of audio-visual equipment.

School representatives meet periodically with the prevocational co-ordinator to discuss problems encountered in work with the handicapped youngsters. In the beginning stages of a pupil's in-school employment, the co-ordinator meets weekly with a school representative. Later the frequency of conferences is reduced. Handicapped children on jobs are seen by the prevocational co-ordinator on a scheduled basis, at least once a month.

A handicapped child's progress on an in-school job is evaluated systematically and continuously by the school employer, the special teacher, and the prevocational co-ordinator using written reports and test results. These evaluations are kept by the co-ordinator in the prevocational offices.

In-school work experience is an abbreviated work

orientation differing from the next level--part-time work experience in the community--by the nature of the work, the length of time the student is involved, and the amount of supervision each child needs.

Pupils perform part-time work in the community under supervision of understanding employers. This entails considerable preparation by parents, pupils, and employers. The prevocational co-ordinator works closely with the vocational rehabilitation counselor in the placement of each handicapped child, aided by the Community Council on Employment of the Handicapped.

The child is prepared for his transfer to a part-time job from an in-school assignment by the co-ordinator and the vocational counselor. Assistance is offered in frequent counseling sessions with each handicapped youth. The pupil's interests and aspirations, and the counselor's understanding of the child, are the basis for selecting individual programs. Although the pupil's desire are an important consideration, the co-ordinator is responsible for final placement. He may assign youngsters to part-time jobs such as:

tray girl (hospital)	2 hours a day
housekeeper (private home)	½ day
Ditto machine operator (university)	2 hours a day
bus boy (hospital)	½ day
maintenance (private home)	½ day
sacker (grocery store)	2 hours a day
newspaper route	2 hours a day
usher (movie)	3 hours a day

Initial planning for placement of each pupil on a part-time community job is considered the most crucial element in the program. The co-ordinator counsels the employer, enabling him to acquire an accurate perception of the child he accepts as an employee.

The placement of children on community jobs does not reduce the co-ordinator's responsibilities. He holds frequent conferences with parents, teachers, and employers, the number depending on the child and on the problems arising in the child's adjustment to part-time work. Special services needed by a child at any time in his progress may be identified by anyone working with him and these services must be provided by the co-ordinator.

The co-ordinator also helps co-operating employers accord handicapped youngsters the same consideration given to any employee. Building respect for the individual does not mean preferential handling of the children. Instead,

the co-ordinator helps work supervisors understand that permitting handicapped youth to "get by" either in performing a job or in behavior is not helpful. The success of subsequent full-time employment of these young people depends on whether or not their tryout experience is successful. Consequently, employers are accustomed to expect handicapped children to comply with regular employee standards. The only aspect of the child's job experience that might set him apart from his fellow employees is that the employer may understand him better than the other workers.

Since handicapped youth on part-time jobs are paid by employers, overseers inform the co-ordinator when work fails to meet expectations. The difficulties facing a child in adjusting to a work situation structure the co-ordinator's action. A child may be counseled by the co-ordinator or the employer, referred to the vocational rehabilitation counselor, transferred to another assignment, or returned to the special classroom.

As in the in-school work-experience phase, continuous evaluation is made of pupil progress both in school and on the community job. Special evaluation forms are filed with the co-ordinator by teachers and employers. To complete records, the prevocational co-ordinator accumulates relevant information obtained from interviews with employers, school personnel, handicapped youth, and parents, and shares the information with the vocational rehabilitation counselor. When a child leaves school, either through graduation or as a dropout, the vocational rehabilitation counselor assumes responsibility for the vocational placement of the child.

Handicapped children who have progressed satisfactorily on community jobs are not abandoned when they leave school. Most of the pupils are helped to obtain full-time employment. Others benefit from a comprehensive evaluation by the vocational rehabilitation counselor as a final determination of their vocational potential. He reviews cases to evaluate students' in-school and part-time work achievement and may administer achievement and vocational aptitude tests. A number of handicapped pupils interested in further training are sent to trade schools. Others having the intellectual ability and the desire to continue academic study may be counseled toward college entrance. When youngsters attain this level, the Division of Vocational Rehabilitation handles their cases.

The Community Council on Employment of the Handicapped is most helpful when children are ready for full-time placement. Members identify employers and jobs for candidates, carrying out this task as another segment of their interpretation of the program to the community.

A systematic follow-up of handicapped youth is an integral part of the prevocational service and is a joint responsibility of the vocational rehabilitation counselor and the prevocational co-ordinator. They interview former pupils and their employers several times during the first year. Though the number of contacts depends on how well the former students adjust, a minimum of four contacts are made the first year and at least two are made annually for the next five years. The follow-up information available in the prevocational co-ordinator's office helps the staff evaluate the curriculum and improve the program.

Example III

CO-OPERATIVE SCHOOL-HOSPITAL EDUCATION PROGRAM
Cranston, Rhode Island

Cranston High School's Co-operative School-Hospital Education Program prepares non-college-bound girls for post-high-school employment as nurse's aides, ward secretaries, and medical secretaries. This is an excellent example of how a school can utilize a community resource to offer some of its young people a work-study program. The program's typical yearly enrollment is twenty to twenty-five students, senior girls exploring and learning nonprofessional-level vocations in hospital settings. Some are good students with definite vocational goals. Others use their experiences to explore medical vocations. Still others are potential dropouts who see the worth of continued education in a practical work-study curriculum. Some of these girls are alienated. They are helped to explore the adult vocational world while learning acceptable work habits and an appreciation of their civic responsibilities.

In the one-year program, students alternate two-week periods of class attendance with two-week periods of work in local hospitals. Each girl receives a certificate and a diploma when she completes the program.

School and hospital representatives planned a definite

---

4. Ibid., pp. 88-101.

program built on the philosophy of using job assignments in hospitals to provide boys and girls with an opportunity to experience responsibilities of work. The job assignments were arranged to permit young people to explore hospital-related vocations while studying appropriate school subjects. These objectives were determined:

To introduce students to jobs related to medicine.

To help students gain a better appreciation of the functions of hospitals and of the way in which they might contribute their individual skills to institutions performing these functions.

To prepare and encourage students to enter hospital-related vocations after high school graducation by teaching them the pracical skills necessary for particular occupations in the hospital.

To provide a school curriculum closely related to the work the students would be performing in the hospitals.

The program provides students with an overall orientation to vocations associated with hospitals and specific training for three jobs: nurse's aide, ward secretary, and medical secretary.

Senior students interested in vocational opportunities in hospital work and having at least 57 points toward graduation are eligible to participate after obtaining parental consent. Although boys have not taken advantage of the program, they are elibible. Though the maximum enrollment is forty, usually twenty to twenty-five girls participate each year.

Student applications are reviewed by the co-ordinator or assistant co-ordinator, who appraises school records and confers with teachers and parents to determine whether hospital work is an appropriate experience for the interested students. College-bound pupils are discouraged from entering the program unless they have established definite vocational objectives that would be furthered by the course content.

The class is divided into two sections to permit rotation of students in the work-study plan. While one group works in the hospitals, the other group attends classes for school credit. Academic work is in four areas: English, science, home economics, and social studies.

The English course, taught in a double period, includes the regular senior-year material and units designed especially for work-study students. Medical terminology, report writing, and vocabulary development are stressed. Material is introduced as an integral part of the work experience. The sequence of subject presentation parallels the girls' work progress.

Science includes units on arithmetic review, the metric system, principles of first aid, common diseases, fundamentals of physiology, and an introduction to basic pharmacology.

Home economics covers these units: grooming, health and personality, patients' needs, medical records and charts, food and nutrition, mental health, principles of art, expenses of illness, spiritual needs of patients, and the nurse as a person.

The social studies course deals with the fundamental concepts and skills, attitudes and resultant ideals, and appreciations that all citizens of a democracy should acquire. Besides regular classroom work and discussions, teachers and students take field trips. To round out the program, various speakers address the class on religious dietary laws, the clergy's visits to hospitals, ethics of the nurse, community services, and juvenile delinquency.

Girls working as nurse's aides wear a uniform with a circular patch on the left shoulder identifying them as program participants. Each fall, when a new group of girls begin their hospital training, a special school assembly is held to recognize their entrance into the program. At this time each pupil receives her patch in a ceremony not unlike the traditional capping of beginning student nurses in many hospital training programs. The uniforms worn by the girls are provided by the hospitals, but each youngster must provide her own hospital-type shoes and a wrist watch with a sweep second hand similar to those worn by registered nurses. Girls working in hospital offices wear regular clothing.

While the girls are on their jobs, they receive a weekly stipend from the hospital. At the large hospital, each student receives $15 a week. At the small one, girls receive $12.50 a week and their lunches.

On completion of the senior year, girls who have earned sufficient credits for graduation receive a regular

high school diploma. In addition, they are granted a certificate identifying the work-study program completed. The certificate carries the course title, since the school also offers a retailing work-study program and an experimental co-operative business education program.

The courses in the program are taught by the regular school faculty. Since the girls are grouped into two sections, the general school curriculum is not disrupted. The supervisor co-ordinates job assignments and schoolwork, informing teachers of the students' experiences on their job assignments and informing hospital authorities of the girls' class activities.

The students' hospital training is supervised by registered nurses or hospital personnel officers, depending on whether the youngsters are assigned as aides or as office workers. While in the hospital phase, students are introduced by supervisors to all the job opportunities available in the institution. In addition, a supervisor oversees each student's work to assure acquisition of skills necessary to perform a particular task. A student on a work assignment is required to complete a program identical with the one expected of an adult trained by the hospital personnel. At both participating hospitals, for example, nurse's aides receive twelve weeks of varied work experience. Cranston students' hospital work assignments are for a twenty-week period.

The co-ordinator visits the hospitals frequently to confer with staff members regarding the students' progress. Meetings are regularly held throughout the school year.

Evaluation of the Cranston program consists of annual follow-ups of graduates. Results of the surveys are most encouraging regarding both graduates' vocational success and job stability. Unfortunately, enrollment in the program has decreased somewhat during the past two years. School officials speculate that the affluency evident in our society prompts many young people to by-pass training such as that available in the program. Administrators and counselors plan to devote renewed emphasis to the program during the next school year. They hope to raise the interest of more of their students, especially the boys who have been reluctant to take advantage of this work-education opportunity.[5]

Example IV

WORK-STUDY PROGRAM TO PREVENT JUVENILE DELINQUENCY
Kansas City, Missouri

The Kansas City work-study program differs somewhat from the other cases in this report. It is unique because it is an experimental project designed specifically for children fitting the definition of alienated youth.

The program was started in September 1961 after two years of preliminary planning by a committee composed of Kansas City school personnel, civic leaders, representatives of a mental health foundation, and the consultant, Dr. Robert J. Havighurst. Interest in the experiment has been nationwide. Representatives of school work-study programs from many parts of the country contributed ideas to the committee and participated in a related workshop conducted by the Kansas City schools in August 1961. The interest of nonschool groups is evidenced by the financial support granted the experiment by the Ford Foundation. This philanthropic organization is sharing the cost of the project with the Kansas City Board of Education.

Two hundred boys were selected for the experiment from the 1960-61 seventh-grade classes of the four junior high schools participating in the program. They were chosen because they had exhibited the behavior characteristics of alienated youth. Two hundred more were selected in 1961-62, making a total of four hundred boys, which was split into an experimental group and a control group. Half of the boys in the former category started the school-work program in September 1961. Those in the control group were not removed from the regular educational program. As the experiment progressed, the boys in both groups were studied and their progress contrasted to determine the influence of the main variable in their school experience--the work-study program--and the behavior of the experimental boys compared with the behavior of the boys in the control group.

The program for the experimental group has three stages. The first is a general orientation period consisting of half-day classes and half-day group work assignments. At this level most boys are in the thirteen-to-fifteen age range. After they complete the first or second year, according to age, they enter stage two. In this stage they continue school studies on a half-day basis and spend the other half of each school day working as part-time paid employees in the community. When they

attain the age of seventeen or eighteen and have completed the first two stages, they will begin stage three--full-time employment on regular community jobs. While on such assignments, boys are to receive regular school supervision from personnel who have worked with them during the preceding four years.

The major purpose of the experiment was to create a new school-work experience for alienated youth that would offer boys a realistic and worthwhile avenue to adulthood. The objective was:

> To reduce the amount of juvenile delinquency by providing boys who are vulnerable to delinquency with a better opportunity for growth into adulthood through combining school with work experience.

The experiment was designed to test the following hypothesis:

> Boys vulnerable to delinquency will become less delinquent if they are given a systematic work experience commencing as early as age thirteen or fourteen and continuing until they reach seventeen or eighteen.

The experimental group participated in the following program:

Work-Study Stage I. This first stage, for boys aged thirteen to fifteen, consists of two parts. They perform socially useful work in and around the school for half of each day. Groups are limited to twenty-five boys and are under the supervision of a skilled worker. During the other half of the day they study an academic program geared to their level and interests.

Work-Study Stage II. The second stage is for boys from fifteen to seventeen years of age who have completed the first stage. Youngsters are placed on community jobs for half of each school day. Co-operating employers and the school employment co-ordinator supervise them on their jobs. Students continue academic classroom work during the other half of the school day. At this level the committee expects boys to drop from school. Some will terminate because they will have reached legal school-leaving age. While efforts will be made to keep them in the program, restrictions will be few and will be kept flexible. Other boys may transfer to a regular course of study. Those desiring to do so will be encouraged to make the transition, though it is not anticipated that many boys

will fall into this category. For the most part, pupils in the school-work program at this level will be boys expected to drop out of traditional curriculum.

Work-Study Stage III. Boys are eligible for this stage if they are between the ages of sixteen and eighteen and have completed stage two successfully. The employment co-ordinator-supervisor will help them find full-time employment. When they are on jobs, he will oversee their satisfactory adjustment from school to work. In accomplishing his task, the co-ordinator will check each student's progress through personal contact and through employers' evaluations. Boys officially complete the program when they reach the age of eighteen and when the supervisor has completed a final comprehensive evaluation of their competence. This step is the final one in the experiment.[6]

In the Progress Report Number Four, compiled by the Work-Study Program evaluators, the following results were summarized:

> In Group I, 87 experimental boys were distributed among five schools. In Group I, 60% of the boys were Negro and 40% were white. In the second group, a more equal racial balance was obtained.
>
> During the first three years of the program over 90% of the experimental youth in both groups had some supervised grou-work experience. About half of them had two or more years experience in working in such group-work projects. In the paid-work experience phase following group work, 79% of experimental boys in Group I and 69% in Group II were placed in a total of 508 jobs with private employers.
>
> Eighty-five percent of paid-job placements were terminated with the highest percentage of terminations due to boys being fired (26%) and boys quitting (25%). Many terminations the first year or two were also due to jobs being seasonal (19%). Boys differed in the number of jobs held and lost. A relatively smaller number (41%) accounted for 70% of all placements made and terminated. Youth also varied widely in the amount of time spent in paid work. In Group I, half of the boys have had over 10 months of paid-work experience, one-fifth

6. Ibib., pp. 133-136.

have been employed in such work for one and one-half years or longer, and better than one-tenth have been consistently employed for periods ranging from two years to three and one-half years. In Group II, half of the boys have had seven or more months of paid-work experience with one-fifth having had a year and one-third of such experience.

The experiment in part was concerned with testing hypotheses that (given conditions existing in school at the beginning of the Work-Study Program) supervised and graded work experience beginning early in adolescence would reduce (1) early school leaving and (2) rates of delinquency among experimental youth in the program.

The results show that while the rate of dropping our for experimental youth was reduced somewhat over that of their controls during the first two years of the program, it was accelerated following the end of the three-year Work-Study school program. This was anticipated since it was at this point that experimental boys were to be assisted by the employment co-ordinator in making the transition from school to full-time employment. It was not anticipated that many control group youth would continue in school past the 10th grade. However, 50% of the boys in control Group I and 56% of the boys in control Group II remained in school in May 1966. This was considerably greater than expected.

In terms of reducing delinquency it appears that in the first two years of the program there was actually an increase of delinquency among experimental boys. A study of this phenomenon reveals that experimental groups were comprised of both serious delinquent and non-delinquent youth from the beginning and that a kind of contagion effect within experimental groups, i.e., delinquent youth influencing non-delinquent youth, was occurring. However, the incidence of delinquency among experimental boys was minimal when they were employed in paid jobs. When the factor of experimental groups being more highly weighted with serviously delinquent youth from the onset is controlled, differences between experimental and control groups in rates of delinquency are minimal.

Within the experimental groups several adjustment subgroups have been identified. One of these is

comprised of approximately one-fifth of experimental youth for whom the Work-Study Program appears to have been particularly valuable. These youth appear to be making very adequate progress in their work-role development. Another subgroup, comprised of about one-fourth of experimental youth, appears to be making progress in work-role development but at a somewhat slower rate while another subgroup of about 20% of boys seems oriented toward school with work playing a secondary role. The remaining group of boys appear apathetic and disinterested in school and work or seriously socially maladjusted, having experienced one or more periods of confinement in institutions for delinquency.

Several factors appear likely involved in some of the findings presented in this progress report. There is some indication that conditions and attitudes existing at the beginning of the program facilitating dropping out of school among this group were undergoing change during the program's operation. In interviews with both experimental and control group boys and their parents at various times during the program, there was an increasing emphasis upon need for high school education expressed which seemed to reflect the theme being presented by radio, television and the press at the time. Experimental youth seemed somewhat less influenced by this kind of social pressure since they saw alternatives to unsuccessful school experience such as being helped to find a full-time job once they terminated school. However, almost 70% of experimental boys did make one or more attempt to continue in school in regular programs following completion of the 10th grade Work-Study Program. For most, the transition from the Work-Study curriculum to the regular program was very difficult. Additionally, there was some confusion and uncertainty concerning grade placement for experimental boys returning to regular school programs and questions concerning the units of credit which should be assigned Work-Study. Most experimental youth were unsuccessful in regular programs, quickly discouraged, and soon dropped out of school. However, in Group I, 25% and in Group II, 42% of experimental youth were in regular school programs as of May 1966, a considerably higher number than was anticipated. Several of these youth are showing considerable progress.

While control group youth tend to remain in school longer than had been anticipated, many of them

appear to be having difficulty. In April 1966, 48% of control group boys still in school were identified as among the three poorest adjusted boys in their classrooms by teachers who were not aware that these were control group boys. Thus, while boys appear to be staying longer in school, many of them do no appear to be making progress in this setting. In assessing differences between control and experimental youth it has become evident that parental attitudes reflected in consent and non-consent for their boys to participate in Work-Study are associated with school adjustments. The evidence suggests that boys whose parents refused to allow them to participate (control non-consents) showed much better adaptations to school than the larger control group, and particularly better than the experimental group. Also, control non-consents had much less childhood delinquency than did boys for whom parents gave their consents for enrolling in Work-Study.

Since 1961, a major part of research activity has been focused upon a systematic on-going collection of information on each individual boy screened for the program. Data collected have been of two kinds, (1) those concerned with describing behavioral outcomes relevant to the purpose of the experiment and (2) data which permit description and some assessment of the conditions, circumstances, attitudes and values associated with these behavioral adjustments and outcomes. Information of the first kind has been collected from schools, police, juvenile court files, records of employment. Information of the second kind has been collected from the boys and their parents through interviews, first at the time the boys were screened, then when they were 15½ to 16 years of age and with a final interview with the boys when they were about 17 years old. Other sources of these kinds of self-descriptive data have been various measures of self-concept, written compositions, opinion questionnaires, etc.

The interview is considered to be a primary source of information concerning the circumstances and personal orientations associated with the kinds of adaptations occurring among these youth. At present, almost 1000 sets of interviews have been collected representing two sets of parental interviews and two sets of interviews with the boys. The focus of

research is now shifting from data collection to data analysis.[7]

A final comprehensive report on this significant work-education experiment will be completed in late 1969 or early 1970.

These reported exemplary work-education programs reveal what can be done in blending vocational preparation with the educational experiences of young people--the academically elite, the middle group, the handicapped, and the alienated. These examples are representative of many successful programs operating in today's American secondary schools. Educators can use such models to institute or re-structure existing curricula. Caution, however, must prevail. Proto-types can provide useful general patterns but cannot be duplicated in entirety in different settings. Work-education programs that will result in success for the participants must evolve in creative ways from their own environments.

NEW AND IMPROVED CAREER CENTERED CURRICULUM MODELS TO SERVE COLLEGE AND NON-COLLEGE BOUND STUDENTS, AND YOUNG WORKERS[1]

This paper will focus on examples of efforts to make the educational program more relevant for all students. Particular emphasis will be placed on programs designed to interlock the concrete experiences of vocational education with the more abstract experiences of other school disciplines.

Introduction

The programs selected for use in this paper have been chosen because they describe an attempt or show great promise of meeting a particular emphasis of the Vocational Education Act. Because of the recency of these special efforts many worthy programs have not become fully recognized and evaluations have not yet presented objective data to conclusively select curriculum models.

The Vocational Education Amendments Act of 1968 reaffirms the need established by the Vocational Education Act of 1963 to make vocational education opportunities available to all citizens in all communities that is consistent with their needs. It further recognizes that vocational preparation and retraining is literally a "cradle to grave" need. Part D--Exemplary Programs and Projects of the Act has two fundamental purposes. One purpose is to identify effective on-going programs, developed prior to this legislation which can serve as models for use in vocational education programs.

The second fundamental purpose of this part of the Act is to provide the means and stimulate interest in creating new more efficient and effective methods for providing job preparation needs.

In order to accomplish these two broad purposes it is essential that freedom must be allowed to trespass beyond traditional limitations. If vocational education is an end unto itself per se, little progress can be made in attaining the imaginative potential goals invisioned by the creators of the 1963 Vocational Education Act. The creators of this legislation were able to percieve that while vocational education was essential for developing the economic power of the nation it was not inimical to development of the ultimate potential

[1]Presented by Dr. George Champion, Director, Center for Technological Education, San Francisco State College, San Francisco, California.

of individual citizens. To the contrary, it was seen that these two adjuncts of vocational education could be greatly enhanced when programs were developed to compliment and reinforce each other.

The expanded function of Vocational Education: Through present legislation vocational education must serve two broad purposes. The first is to be responsive to the talents and skills required by business and industry. The second purpose is in developing human resources so that every individual has the opportunity for developing and utilizing his optimum capacities.

It is no longer possible to speak sensibly of education as being compartmentalized into general or academic and vocational components. This costly division in American education has on the one hand, produced high school graduates without even the basic language and mathematics skills required to function in the workaday world and, on the other, has pushed 40% of all children out before completion of high school.

American education has long professed to recognizing two basic needs common to all people. First, it recognizes the need for basic general education required to participate fully as a socially responsible citizen. Secondly, it recognizes the need for each person to possess those specialized skills and knowledges required for economic productivity.

For too long these two basic needs have been separate programs within the curriculum. Through such separation both suffer. Special or occupational preparation is almost invariably considered lesser than or inferior to general or academic preparation, and for many students general preparation loses much of its meaning when he sees no practical application for the information.

Programs should be planned to avoid this artificial separation and fuse them together so that each serves to compliment and reinforce the importance of the other.

Vocational Education for all: If the premise is accepted that vocational education is a need for all persons and must be available in terms of their own needs, it is, therefore logical to assume that the career development component of the curriculum must be greatly expanded. Opportunities for career development must be established to encompass the interest and ability range of all. Programs must be planned which are appropriate in terms of age, ability, interest, and other special circumstance.

The scope of such a challenge extends beyond the educational system. Educational and community leadership is required to cope with the dynamic challenges of preparing youth and adults to function at an optimum level in a complex and rapidly changing technological age.

A totally functional system of education depends upon the full utilization of all community resources. These include business and industry, public and private agencies, and public and private institutions. The system must provide a linkage between the many community resources affected by or affecting the educational process and provide the means for immediate and continuous interaction. The system must also be devised to bring the community resources to the educational process, but also provide these same resources to individuals as their needs may demand

New Directions

The 1963 Vocational Education Act mandated new programs to meet new needs and to serve new purposes. Emphasis of the Act was focused upon those persons both in and out of school who needed occupational preparation but were not being served by regular vocational programs. This focus emphasized the social and economic problem of long-standing caused by those persons leaving school unprepared to enter the labor market. These young persons faced long periods of unemployment or marginal employment. Concurrent with the mandate for new programs to meet new needs there continued the obligation to maintain, expand, and improve ongoing programs.

Freed from rigidly defined program lines, intensive efforts have and are now being exerted to devise new programs and to develop more efficient and effective means of attracting students and preparing them for employment. Such new and innovative efforts do not necessarily compete or challenge ongoing programs, however, in many instances they do have a residual benefit that in addition to meeting their primary purpose they also offer ways and means for improving existing programs. The converse of this is also true, that is, successful practices which have been developed in vocational education over the years can be drawn upon and utilized for new programs.

In assessing the literature it soon becomes evident that while there has been a flurry of activity at improving the program and process of vocational education there has been little done to systematically develop a prototype curriculum model. While the research and developmental efforts have been focused on programs, and the ancillary requirements of programs they are fragmented and the elements have not been pulled together into a total package.

The following programs which are reviewed have been extracted from the Advisory Council on Vocational Educations' report on vocational education.[1]

These programs reflect some of the new and innovative practices which appear to have significant implication for vocational education. They stress the intent of vocational education to be broadened to include new groups of persons to be served and new methods to be employed.

Comprehensive Planning: The "zero-reject" concept developed for curriculum planning in the San Mateo Unified School District, San Mateo, Calif., is an example of one approach to comprehensive planning. The zero-reject concept assumes: (1) That the state of the art in education today makes it possible for every student to earn a high school diploma with significant standards and a broad liberal and vocational education; (2) that more individualization of education is possible through a wider variety of known learning strategies, even though much more research is needed in this field; (3) that vocational education and general education are mutually supportive and equally necessary; one does not take precedence over the other; (4) that work in and of itself can be a rewarding element of the full life beyond economic independence, and it is a common denominator of concern for all Americans; (5) that practically speaking, there are no unskilled jobs, only unskilled people; (6) that the schools have the responsibility for seeing that students are employable whenever they choose to leave school; that may be as a dropout from grade 10, or with a doctorate after 23 years of education; (7) that educational goals can be expressed in terms of cognitive, affective, and psychomotor skills, and that each occupation requires a differing mix; (8) that occupations can be grouped by clusters and by levels, and that they form ladders of progression through the various educational levels; and (9) that education is a lifelong process and that the school provides the direction and climate for continued learning. Within the context of the zero-reject concept, disciplines are established for the benefit, convenience and development of trends for improvement

---

1. Vocational Education--The Bridge Between Man and His Work. General report of the Advisory Council on Vocational Education, 1968. U. S. Department of Health, Education and Welfare., U. S. Office of Education, OE 80052, 1968.

of teaching and understanding. The fact that they have become institutionalized into separate watertight compartments in the schools has been largely for the convenience of administration. If performance objectives can be stated clearly, it is then possible to utilize discipline components to build a mix amendable to the student's own learning strategy. By progress checks built into evaluation and achievement in each small learning package, it is possible to know where the student is and how he can be helped. In this way, the teaching process becomes the institutionalized management of learning instead of the vehicle for surveying abstractions.

Earlier Introduction to Vocational Information: The question about when vocational education should start in the education process is one of serious concern. There are those who advocate, in light of the trend for students to stay in school longer, that vocational preparation should be postponed until the post-high-school level. Others point to the large numbers of persons who do not complete or go beyond high school, and they maintain that vocational education should be a function of the high school. From both points of view, vocational education is seen within the limited perspective of entry level job training. But there is also a growing acceptance of the need for a continuous vocational education from early childhood throughout life. This can be inferred from a report prepared for the Commission on Technology, Automation, and Economic Progress. It stated that:

> Nothing short of education throughout the entire lifespan is sufficient to provide individual fulfillment and mastery of the environment. Because culture changes which once encompassed centuries occur now in a decade, man's ability to manage change requires continuing education throughout life. The general educational level of the public governs the pace with which new knowledge can be absorbed, adjustments made to new developments in science and technology, and solutions reached to concomitant social, political, and economic problems. There is no such thing as terminal education. Lifelong learning is a universal necessity since we are living in a learning society.[2]

---

[2] Educational Implications of Technological Change, app. Vol.IV, "Technology and the Human Economy." Studies prepared for the National Commission on Technology, Automation, and Economic Progress, pp. 67-68, 1966.

A project underway in New Jersey supports the potential values of vocational education for its informational and motivational values, and its relevance to the elementary school level.

"Technology for Children", a project sponsored by New Jersey State Department of Education and the Ford Foundation, exemplifies the mutual value of vocational information and general education. This project was initiated with two basic objectives: (1) To enhance learning at the elementary school level, and (2) to enlarge the child's understanding of vocational choice and to develop his economic competence in a changing world of work through establishing a systematic program of occupational education throughout grades K-12. The rationale for the program was an attempt to help children develop a way of thinking where design is construed to mean the seeking of the simple, direct solution to a problem. The program also provides an environment where children can test their solutions, as well as try out and increase their effectiveness in dealing with the materials of the environment.

It should be noted that as the emphasis moves from vocational training for a specific occupation to vocational education in the broader sense, it begins to encompass the entire spectrum of the educational system. Early experience from MDTA and other remedial programs has demonstrated that this is an essential characteristic necessary to render people employable. The initial MDTA programs were designed for specific job placement training. It was discovered that for many, vocational preparation was ineffective because they lacked a sufficient development of basic educational skills, and it was necessary to incorporate basic education as an integral part of the program. This same condition has been reported as a problem in ARA and OEO programs as well. It should also be noted that the experience derived from these same sources suggests that there has been a positive response by students to the inclusion of basic education in the program. As it becomes a part of his vocational preparation, the relevancy of the basic education becomes clear and is accepted, whereas the same information formally presented in isolation was rejected.

The problem appears to be more in the nature of variety, scope, and sequence. As orientation and informational programs are developed at the elementary and junior high school levels, the need for articulation between all levels and all disciplines will increase, and as articulation between levels takes place, it will reflect the type and structure of programs needed for the elementary, secondary, post-secondary, and adult levels.

Partnership Vocational Education Project: A number of efforts are currently being made to bridge the separation between educational levels. One such program is the Partnership Vocational Education Project at Central Michigan Universit Mount Pleasant, Mich. Here emphasis is placed upon the articulation between levels of education as well as between disciplines. This program is structured much the same as the Pre-Tech Program, to be discussed later, but it has been fully planned and articulated, beginning in the high school and continuing through the community college, and the university. Students may progress through the educational levels with minimum loss in time at the beginning of each level. The high school program begins with a relatively broad approach to the study of American industry, with opportunities for exploration and attaining an understanding of vocational opportunities and the required preparation needed for various occupations. The high school program is aimed at accommodating three levels of students. Graduates from the first group--those who have ability and interest for college--are seen as recruits for teaching and for careers in the areas of technology and applied sciences. The intermediate level students are those who may want to enter the labor force upon traduation or enter the community collete for the post-high-school technical training. The third level will accommodate students who are probably not capable of college success and who will enter the labor force on graduation. None of the students are locked into a level, and all may shift to another program if it meets their needs better.

The community college program is designed to give the students special proficiency in his selected field. The proficiency preparation at this level is augmented with other subjects which are also correlated through interdisciplinary planning. Students completing the 2-year community college may elect to go into the work-force or transfer to the university.

The program at the university level continues the interdisciplinary, team planning approach.

The Cluster Concept: Articulation may also be accomplished through an interdisciplinary structure of the curriculum. Through organization of the common elements of diverse occupations, a core of information or cluster of conceptual relationships can be established.

The cluster concept as an approach to vocational education is developing wide interest. A research project based on the cluster concept is presently under way at the University

of Maryland, College Park, Md. This project recognized the delimma and controversy about whether vocational education should prepare highly skilled students for specific occupations or should provide broad programs of general training for a wide variety of occupations. The cluster concept program being developed at the university is aimed at a middle ground between these two points.

Two of the major objectives of the cluster program are:

1. To provide the student with greater flexibility in occupational choice patterns. This provides the student with an opportunity to obtain skills and knowledge necessary for job entry in several related occupations, and also an opportunity to appraise his own interests and abilities in relation to the several occupations in the cluster.

2. To provide the student with vocational competence that affords him a greater degree of mobility. The opportunity for mobility is seen as both geographic and on the job. The skills developed are seen as being both employable and transferrable. The student who has the opportunity to prepare in a cluster of occupations will probably be better prepared for technological change. Changes on the job will be expected rather than feared as in the past.

Within this program, the students are prepared to enter a family of occupations. While there is sacrifice in depth compared to specific job preparation, the students retain an element of final choice. The program also avoids the danger of closure if any one of the specific occupations within the family becomes obsolete or eliminated through technological advance, and allows a relatively easy adaptability as job requirements change.

Pre Engineering Technology: The Pre Engineering Technology Program, also known as the Richmond Plan or Pre-Tech Program, was initiated by the Richmond, California., High School District and Cogswell College, San Francisco, Calif. It was established as an interdisciplinary program oriented toward preparation as an engineering technician. The initial population selected for the program were students who, by criteria available, were capable and average, but were achieving at a rate lower than should be expected by their ability--a common and often neglected population found in most schools.

The contributing disciplines were selected for their relevancy to the preparation required of an engineering technician. An analysis of this occupation identified the need

for persons who were well founded in basic science and mathematics and could manipulate the concepts of these fields mechanically. It was also found that effective communication was an essential element in the technician role. Hence, mathematics, science, English, and technical laboratory were selected as areas, and a teacher from each of the areas and a counselor constituted the teaching team. The team was assigned a common preparation period for planning curriculum units. Emphasis in planning was placed on developing maximum reinforcement of the disciplines through emphasizing their interrelatedness.

The curriculum objectives of the program are clearly defined in measurable terms. As a result, students not only know what they are doing, but more importantly, why they are learning a particular thing at a given time.

A functional objective of the program is to prepare and motivate students for continued education toward a career. The program establishes salable skills for each level of education, but is planned to be articulated and nonblocking.

One of the significant results of this project has been the demonstration of the effectiveness of the interdisciplinary process in program development. Presently there are approximately 40 schools in the San Francisco Bay Area with programs using the interdisciplinary process adapted to 12 different occupational goals.

Project FEAST: One of the more effective adaptations has been the program in commercial food services. This program, Food, Education, and Service Training (Project FEAST), draws upon home economics, science, English, and mathematics as the discipline elements. The program was developed to test the adaptability of the Pre-Tech Program to other occupational fields or clusters. It was developed cooperatively by the Hotel and Restaurant Foundation of San Francisco City College, Pacific High School, San Leandro, Calif., and Oakland Technical High School, Oakland, Calif.

The occupational objective of Project FEAST was prepation for the rapidly growing hospitality and service industry. The program is designed to accommodate students with all ranges of ability. This program, like the Pre-Tech Program, is planned to establish salable skills at each transition level, and also to prepare for the next level of education. The project makes effective use of a strong industry-labor advisory committee. Through this committee, the program has been benefited in two important ways: through (1) the benefit of the members' experience for continued program improvement and (2) the opportunity to place students in work experience

during their program and job placement upon completion of their program.

A New Discipline: The Nova Schools, Fort Lauderdale, Florida., and the American Industries Project approach curriculum innovation from the point of view that American industry or technology represents a body of knowledge which can and should be formulated and structured as a discipline. The rationale for the Nova approach and the implications for vocational education have been reported as follows:

> In this scientific age, technology exerts a powerful force upon society. To some degree technology affects everybody every day. All of us are dependent upon the goods and services that modern technology makes possible. As a body of knowledge, technology is not the exclusive possession of engineers. A safety pin is just as important as the Apollo spacecraft. It all depends on what your need is.
>
> Without technology our lives would be vastly different. The potential of technology for good or evil is awesome. It is certainly important, perhaps vital, for all of us to be aware of the origins, principles, concepts, processes, and products of technology. To encourage maximum development of the potential of technology for good, renewed efforts should be made:
>
> 1. To develop a curriculum in technology for all levels of learning from the very early elementary grades onward.
>
> 2. To study technology as a new academic discipline designed with appropriate balance between theoretical understanding in a conceptual arrangement and the development of manual skills.
>
> 3. To give equal status to the discipline of technology in the school curriculum, on a par with the traditional disciplines.
>
> 4. To correlate the areas of science, mathematics, social studies, and language arts with the technology curriculum. For the development of attitudes and values relating to the responsible use of technical skills, there cannot be any clear delineation between disciplines.

Technical and Vocational Implications of the Nova Pre-Employment Program:

1. Every Nova student will be required to elect one of the technical science courses each year he is enrolled.

2. A student will participate for a varying amount of time. The modular schedule at Nova gives each student about 25 percent unscheduled time. This time can be used for technical and vocational courses.

3. Each student will be enrolled in science, social studies, English, mathematics, and foreign language in addition to technical science. There is some flexibility in time in these courses. There will be units and activities in these disciplines which directly relate to the student's interest field.

4. Achievement in technical and vocational skills will be measured by competency rather than by time in class. The advisory committee will help determine competency levels.

5. Materials are being developed to a sophistication level which will allow each student to progress at his own best rate. He will have a choice of activities to reinforce his knowledge and skill development.

6. Teachers who are involved in the technical and skill development phases of the program will be vocationally certified. They will be teamed with other certified personnel for curriculum development and related material presentation. This teaming will provide needed in-service help for each team member.

7. All goals or objectives are stated behavorially. Evaluation devices will emphasize visible behavorial changes.

8. Emphasis will be placed on the attitudes and habits which go with successful job performance which should help the prospective worker understand how he fits within the economic and civic institutions of our country.

9. By teaching concepts and by employing the problem-solving techniques of instruction, the school will help the student cope with the changing labor market. An awareness of the concepts of the machinery and processes in his work world will prepare him for retraining when it becomes necessary. The worker's confidence in himself should also be strengthened through an understanding of the basic concepts of his field.

10. Every attempt will be made to offer instruction which

is so closely identified with current industrial and business techniques, that the student will be prepared to enter the real world of work.

11. Nova students will be prepared and encouraged to continue their technical education at college. Laboratory facilities at Nova will be available to the junior college students when necessary. Very close cooperation between schools is anticipated.

The American Industries Project, at Stout State University in Minnesota, assumes the same basic orientation as the Nova approach. That is, that American industry provides a body of knowledge which can be analyzed in terms of identifiable concepts.

This program views American industry from a global perspective as representing a body of knowledge from which content for the curriculum can be derived, and, secondly, that from the total body of content, organization into specific curriculum objectives can then be based upon the general objectives of that curriculum.

While the theoretical structure and body of knowledge are still in the process of development, three distinct levels have been identified and courses are now being developed. The broad objectives of the first level, to begin at the eighth grade, are to (1) develop a knowledge and understanding of the major concepts of industry and their relationships, and (2) develop the ability to solve simple problems related to industry. At the second level, the objectives are to (1) develop in-depth understanding of the concepts of industry and to refine the relationships among the concepts, and (2) expand the ability of recognizing and solving the complex problems of industry. The third level is concerned with the development of knowledge and problem solving skills within a concept area or cluster of concepts appropriate to the individual's interest and abilities.

Teacher Education: An inherent characteristic of the programs cited is a common concern for programs which meet both a social and individual function. They recognize that knowledge and technological development depend on each other, and are accepted as good in the life and progress of man. Each of the programs has drawn heavily from the disciplines of psychology and sociology in developing the programs and has also relied, to a great extent, upon the natural curiosity and motivation of students.

Teacher training or retraining is a functional part of each project. The need for teacher reeducation in light of rapid change is becoming apparent. The need is especially notable when different disciplines are brought together in

program development. Experience in interdisciplinary programs has demonstrated that teachers must develop a genuine understanding of the other disciplines involved for effective interdisciplinary teaching. It has also been demonstrated that teachers must learn to become more flexible in adapting and adjusting their teaching methods and timing to coordinate with the other disciplines. They must develop a freedom from defensiveness regarding their lack of knowledge in the other disciplines.

It is significant to note the emphasis which has been placed on eliminating the barrier between vocational and general education. In describing his role in an interdisciplinary program, an English teacher made this type of summary:

> Few teachers know or care what the teacher next door is doing if he is from another department. Most high school education is compartmentalized--not only watertight--but idea-tight. * * * Teachers widen their own knowledge by crossing subject lines * * * and students are motivated when they see that their teachers are interested in all of their subjects.[3]

One of the common mistakes of curriculum development and change is failure to anticipate the future professional staff needs as the programs move from the experimental phase into the implementation phase. In most innovative programs, development and implementation are carried out by the same staff. Too often, however, the innovation fails as the program is implemented beyond the original staff because teachers, counselors, and other professional staff expected to carry on the program are unfamiliar or vaguely familiar with the philosophy, concepts, and methods which underlie the program.

In each of the foregoing projects the need for professional staff preparation is recognized and planned for as part of the development process of the specific program. While this is essential and necessary for the success of the specific programs, it fails to provide an adequate base for teacher education in general.

In recognition of the need for a more comprehensive approach in professional staff preparation the Improvement of Teaching Project at Mississippi State University, State College, Miss., has initiated a teacher education program to prepare and retrain teachers for vocational education. The program

---

[3] Curriculum Programs in Action: Report of a conference sponsored by San Francisco State College and University of Wisconsin, San Francisco, Calif., February 1967, p. 24.

places emphasis on the preparation required for coordination and articulation between the levels of education. It recognizes the variety of teachers required and provides flexibility to meet this need through individualized programs of study for those in training.

The project aims at upgrading and retraining through planning new programs. As research indicates a need or provides evidence which supports a program or process, planning is initiated to develop the curriculum materials necessary for implementation. The professional staff preparation also provides for internships, faculty exchange between the high schools and junior college, and assistance for training currently employed teachers.

One of the techniques used in the program which appears to be effective in the improvement of teaching is the team planning concept. The team, representing several disciplines, plans programs or units of work which coordinate the disciplines. It appears that teachers involved in team planning develop a greater flexibility and are better able to adapt to changing conditions.

Trends, Objectives, and Assumptions: While there were marked differences among the projects in terms of content, organization, educational level of the program, type of population to be served, approach, and methods employed, there were also commonalities. Through conference and discussion the representatives identified what they felt were common elements of the programs and might be considered as indications of trends.

Some of the more significant trends and directions would appear to include:

1. Greater individualization of instruction.

2. More comprehensive programs in which the disciplines are brought into interaction to maximize reinforcement and to highlight the relatedness of the disciplines.

3. Programs which recognize that the separation of vocational and general education detracts from both and when they are brought together, they serve to improve and enhance each other.

4. Planning which accepts the fact that not all students learn in the same way, nor will they learn the same things under the same circumstances.

5. Program planning based upon the assumption that schools fail students rather than students fail school.

6. Programs which place greater responsibility upon the student for his own education and for making decisions.

7. More comprehensive programs to accommodate a greater variety of individual needs and differences.

8. Recognition that teacher training and retraining in line with specific objectives or conditions is an essential element when change is required.

9. Teachers are becoming managers of the learning environment rather than purveyors of information.

10. Systems are slowly beginning to reorganize to accommodate the learning process rather than the teaching function.

11. As education, like society, becomes more complex, the team strategy for planning becomes essential.

12. Curriculum designed and developed through an interdisciplinary approach is more likely to meet the needs and interests of students than that developed within the constraints of a single discipline.

13. Curriculum developed in terms of a total program in contrast to course development.

14. Recognition that education can no longer be planned within the confines of the school, but must coordinate with community resources and agencies.

15. Recognition that funds and time must be provided for program development, and programs must be planned and evaluated to reflect constant interest in maintaining maximum economic and educational efficiency.

16. Earlier introduction to the world of work and to the many opportunities which exist.

These trends appear to identify some of the objectives to be considered in planning programs with new directions. Such planning would call for and support:

1. A curriculum plan that embodies and stresses methods of inquiry, techniques of learning, and educational procedures that will maximize learning opportunities for students at all educational levels.

2. A flexible, varied program that recognizes the individualized selection of applied fields of knowledge and provides for guidance to realistic career choice involving

local resources and institutional philosophy as the context for school learning experiences.

3. Emphasis in the design of integrated curriculum directed toward enabling the student to derive beneficial intellectual concept experiences, productive, behavioral attitudes, and attendant psychomotor outcomes.

4. Identification of the goals of education in terms of specific student behavior in a developmental program.

5. The opportunity to identify specific objectives for education in terms of curriculum, personnel, and facilities.

6. Provisions that foster maximum teacher flexibility, innovation, and experimentation in the development of instructional materials commensurate with expressed educational aims.

The trends identified exemplify methodology and techniques that are presently being tested in practice and are being examined for applicability on a larger scale. This attempt to utilize existing successful approaches may prove valuable in (1) fusing vocational and general education curricula and implementing a workable educational system that focuses on a continuous process of career development, and (2) providing for the optimum development and utilization of human resources in our changing society.

While it is accepted that occupational preparation leading to employment is fundamental to vocational education, it is also apparent that technological changes and Federal legislation have greatly expanded the base for selection of occupational preparation. It is generally agreed, as suggested in the preceding discussion, that vocational education must serve two general purposes: (1) To prepare persons to meet the demands for the labor market, and (2) to help develop human resources to their optimum potential.

In view of the expanded role, the frame of reference of vocational education should shift from job-centered training to that of employability which includes other educational characteristics essential for job attainment and career mobility.

For effective planning within the described framework, a number of assumptions must be made:

1. Vocational education is the right of everyone who desires and can profit by it, and it is the responsibility of the schools to provide for it within the curriculum.

This assumption precludes program limitations as they

now exist in many instances, and establishes the need for a broader and more inclusive vocational program based upon individual needs and work opportunities. Such planning establishes the base for the schools to become responsible for the student in transition to the next level of education or to work.

2. Vocational education is a continuous process from early childhood throughout life.

The process can be roughly divided into four phases which prescribe themselves to general levels of education. The types of programs which are appropriate and can be planned for each level are:

a. Informational and orientational;
b. Orientational and exploratory;
c. Exploratory and preparational;
d. Upgrading and retraining.

The phases, of necessity, do and should overlap to accommodate individual needs at a given time.

3. Vocational education, like general education, is a responsibility of the total school and cannot be limited to a single discipline or department.

While administrative responsibility for vocational education may be centrally located, it is the responsibility of the administration to encourage all elements of the school to contribute to the vocational commitment.

4. Vocational education programs can be developed which serve as nonblocking career ladders, and they can be planned to be consonant with the goals of both general and vocational functions of education.

This will require vocational planning which articulates between the levels of education and provides maximum opportunity for the student to attain his desired and optimum development. Through such articulation, the transition of the student to the next educational level or to work will be more efficient and effective.

These assumptions establish vocational preparation as a total school responsibility and eliminate the artificial barrier existing between vocational and general education. They establish the fact that vocational education cannot take place without sound general education, and general education does not exist when it does not include vocational education. Thus, education is required to assume responsibility for every student in the transition between educational levels and from education to work.

The foregoing programs are in-school attempts to make education more relevant and attractive to students. Through these programs it is hoped that the schools can retain the students for longer periods of time and that the students will profit from better and more meaningful education. Significant also is the attempt to provide a salable skill for all students and also the basic educational preparation necessary for entry into the next level of education.

Programs for Out of School Youth: It is becoming more and more evident that in our society the opportunity for the high school dropout to obtain meaningful full-time employment without training is virtually impossible. While programs aimed at this problem have not been generated as rapidly as in-school programs there is beginning to emerge some evidence of success in meeting this challenge.

There appears to be great merit in public service radio and television commercials encouraging students to remain in school, and those which direct students to employment counselors where job training and job opportunities can be explained.

A major "out-reach" thrust is aimed at the high school dropout in the state of Iowa.[4] Now in its second year, the "Governor's School Dropout Program" attempts to reach every youth who leaves school before receiving a diploma. Each reported dropout receives a letter from the Governor, first asking him to reconsider his decision about leaving school. If this does not appeal to him he is then asked to visit the nearest Employment Service Office for assistance in obtaining employment or entering one of the manpower training programs.

The plan requires the cooperative efforts of the Governor's office, local school district offices, the Manpower Council, the Iowa Employment Security Commission with its local office, and the various training components available in the State. Specially designated counselors are assigned to the program to explain the various opportunities for employment or training.

While the follow-up of this study has not been completed there are enough responses to conclude that:

1. Outreach services are definitely needed to contact dropouts.

---

[4] Project Profiles No. 15, Iowa State Manpower Development Council, State Capitol Building, Des Moines, Iowa.

2. Community Action Agencies can provide further services once the contact has been made.

3. Of the youths reported, a significant number had found jobs on their own, however, most of these jobs are in the unskilled labor area such as waitresses, laborers, farm hands, etc.

The program has shown enough promise that the United States Department of Labor has urged all State Employment Security Agencies to adopt this plan at the State level through the Governor or at the community level through the Mayor.

Ancillary Program Requirements: All too often excellent experimental programs fail to continue or expand after the experimental period. This is usually caused by failure to consider the ancillary aspects of the program. An experimental program is most often conducted by persons involved in developing the original idea. This same degree of enthusiasm will not be found when the program is attempted with other personnel. Therefore, as new programs begin to show promise, plans should be made to implement a complimentary teacher education or re-educational program.

Other related considerations which effect the transmissibility of programs from one location to another include assessment and evaluation, curriculum and media materials, alternative teaching methods, financial requirements, etc.

Summary

The Vocational Education Act of 1963 coupled with current social and economic problems stimulated intensive efforts directed at developing, testing, and implementing new vocational programs. Through these efforts many programs offer promise for greatly improving the quality and availability of vocational education.

Because of the relatively recent emphasis placed on this area of education the results are fragmentary and time has not permitted adequate evaluation and assessment of new programs. There are, however, a number of innovative programs which appear to have significant implications for vocational education.

The programs identified in this paper are representative of programs which can be considered innovative and directed at meeting the needs of new groups of persons to be served by vocational education.

Programs of long standing and those for new occupational fields modeled after conventional programs were not reviewed

in this paper because they are already well known and possess high visibility. It should not be implied that they have less value in serving as exemplary programs than those cited. Careful consideration must be given to both new attempts and traditional practices, to insure that the best is retained and only the obsolete and less effective elements are deleted.

The role and importance of vocational education takes on new dimensions as the labor market demands change to require higher levels of preparation. There is growing recognition that far too many youth are leaving school inadequately prepared to enter the labor market. Therefore, education must assume responsibility for the occupational preparation for a much larger portion of the school population than they are now serving.

Further, there must be constant out reach for those persons who have left school and are poorly prepared for anything but marginal employment.

It is imperative that continuous efforts be devoted to seeking new, more effective means for meeting the vocational needs of every person.

PART I INTRODUCTION

The theme of this part of the National Conference on Exemplary Programs and Projects deals with topics mainly derived from Subsections 143 (E),(F), and (G) of the Vocational Education Amendments of 1968, which provides that federal funds may be used for exchanges of personnel between schools and other agencies and organizations; programs and projects for young workers released from their jobs on a part-time basis; and programs and projects at the secondary level to motivate and provide preprofessional preparation for potential teachers. The assignment also calls for study of exchange programs for resource materials, and the exchange of occupational information.

The objectives of this presentation are:

1. To trace some of the background work of the Advisory Council Report and other testimony which relate to the exemplary section of the Vocational Education Amendments of 1968.

2. To review studies and recommendations found in literature which relate to personnel, resource materials, and occupational information exchange programs.

3. To describe four specific programs, drawn from experience, which appear to have exemplary aspects.

4. To summarize the material treated and present some tentative guidelines for further implementation of exemplary practice in vocational education.

Roots to Federal Legislation

Roots to the exemplary sections of the new Vocational Education

Act may be traced back to the recommendations of the 1968 Advisory Council Report, and to testimony presented before congressional subcommittees. Specific examples of the direct lineal relationship between testimony and Law may be seen in the Advisory Council's Legislative Recommendation number 14, the testimony of Burkette, Burt, Hoyt, Essex, and Evans, and many others who would make the bridge between man and his work a living reality.

The Advisory Council Report, prepared for the Subcommittee on Education of the Committee on Labor and Public Welfare, United States Senate, made 26 legislative recommendations. Number 14 of these recommendations stated that:

> The Act recognize the need and provide support for professional and paraprofessional staff recruitment, preparation, and upgrading at all levels, including leadership, administration, teacher education, and counseling and guidance on a state, regional, and national basis...
>
> In recognition of the new and emerging occupations, the growing importance of work experience in education, the need for closer liaison and cooperation between industry and education, the rapid change in the skills needed within specific occupations, and the need for continuous curriculum revision and development; provisions are needed which will permit preservice and inservice programs for preparation and upgrading of professional and paraprofessional personnel... The provision should include fellowships, leaves, internships, the exchange of personnel between industry and education, and between federal and state offices.[1]

Burkett's testimony before the U.S. House of Representatives General Education Subcommittee on May 1, 1968, endorsed passage of the Vocational Amendments Bills then before Congress. When asking for the authorization of federal funds for exemplary programs in vocational education, Burkett recommended that such projects could include programs designed to familiarize post-elementary students with the broad range of occupations for which special skills are required, and the requirements for careers in these occupations, and among other recommendations, programs to provide for exchange of personnel between schools and other agencies, including manpower agencies and industry.

The March 14, 1968 testimony of Samuel M. Burt, Senior Staff Member, W.E. Upjohn Institute for Employment Research, before the House Subcommittee, mentions the unique character of vocational and

At Rutgers University, the internship is a required portion of the doctorate in vocational-technical education. In each of the three main areas of concentration -- college teaching, research, and administration -- the doctoral candidate is given a "tailor-made" learning experience with a cooperating industry, educational institution, governmental agency or research organization for a period of one term. It is designed to insure that each candidate possesses the skills, abilities, and understanding considered essential to the practitioner of his particular area of specialization. Secondly, it insures that the intern is capable of performing with confidence and authority the tasks associated with his chosen field; it is a means for mixing theory with practice, serving as a realistic avenue of the transition from past employment to future leadership positions.

Two other cooperative programs for professional personnel are conducted at Rutgers. These are the Cooperative Work Experience (COPE) Program and the Master Teacher Externship. The COPE program is designed to provide high school and technical institute graduates with the opportunity to combine supervised work experience in a chosen trade or occupation with a baccalaureate degree program. After the student accrues a minimum of 5,000 hours of approved work experience, he is required to pass an occupational competency examination. Satisfactory completion of the work-experience element of the COPE program, together with appropriate professional and academic subjects also allows the student to meet state certification requirements for teaching a vocational subject.

The Master Teacher "Externship" at Rutgers is especially designed to provide a post-graduate updating kind of experience which cannot be acquired in the setting of the classroom. Specifically, the program provides for occupational experiences to vocational-technical graduate students who are in need of strengthening and updating their competency in a particular trade or occupation. Prescribed through advisement, the externship phase of the Masters program is an opportunity for learning by doing - and for receiving graduate credit in the process.

Inter-Institution Sharing

The Whittier-Somerset Project is described as a case study in urban-suburban school cooperation. It shows how parents and community leaders of both an affluent suburb and an inner-city community use their respective schools as the foci of cultural exchanges and social understandings. Two schools - one where children must learn under the pressures of an urban society, the other removed from such pressures but at a disadvantage because of its insulation, are paired together to embark on a program of common experience, common planning, common understandings, to achieve common goals.

Among other reports of institutional cooperation are Hurt's description of cooperation between vocational educators; Stoffel's account of "Project Interchange" in Ohio schools; and Salwak's "New Patterns of institutional cooperation," which reports on the status of inter-institutional sharing of educational resources. Hurt's article, which tells of joint activities between home economics, business and distributive education teachers in Colorado and California, suggests that more cooperative efforts between various vocational education divisions will result in more relevant programs. Another proponent of incorporating an occupation mix into vocational curriculum is Struck who urges teachers and supervisors to coordinate their unique competencies in each area of specialization. According to Struck, administrators have not taken the initiative to achieve the occupational mix and the coordination and cooperation between teaching areas of vocational education which is desirable and much needed.

Kelly speaks of the Ford Foundation supported program in San Francisco in which cooperation between business, industry, government, and education is focused on the organization and administration of two-year college programs for high ability problem youth at Golden Gate College. The cooperation of a dozen leading companies in San Francisco had been assured prior to the college's grant application to the Ford Foundation, it was reported. The UCLA program for the improvement of trade-technical teacher education provided an opportunity for selected teacher educators from southern colleges to get away from their local and immediate problems and observe an extensive operation involving more than 500 California Trade and Technical teachers. Included in the program were periods of observation of the UCLA team approach to teacher education.

Gorman's investigation of characteristics, background and job experiences of successful and unsuccessful entry workers in mining, lumbering and construction had an interesting component. Four teen school guidance counselors took part in the study by gaining active employment in the three heavy industries. It was reported that the major goal of the project was to provide school guidance counselors with a work-research experience which, as they returned to their positions, would contribute to their becoming more competent vocational counselors of non-college bound youth. As might have been predicted, the counselors, quickly thrust into hard, heavy and dangerous employment appeared to need more time for acclimation. In spite of blisters and aching backs gained from the experience, however, participants strongly endorsed the idea that guidance counselors do need practical work experience. Counselors also proposed the establishment of a joint industry-education board to facilitate evaluation of vocational education curricula and to ease the student's transition from school to job.

Nyquist's paper on emergent functions and operations of State Education Departments, prepared for a conference at the National Center for Vocational Technical Education, says that increasing national interest in Education; the growth of Metropolitan areas which cross state lines; the nature of educational problems which cross district and state boundaries; and the establishment of research and development groups over wide geographical areas are tending to break down earlier state positions of sovereignty and isolation. According to Nyquist, the direction of the future is clear. Regional and National cooperation between the states; the gradual relinguishment of territorial imperatives, and rising level of competence in all State Education Departments may be expected.

Cooperative Education: The Sleeping Giant

The cooperative system of school and work instruction is finally getting the recognition and support it deserves. It is a powerful stimulating experience to students, especially those who have inadequate opportunities to otherwise learn about the working world. John Dewey, who was one of the early proponents of school-work fusion, believed that the only adequate training for occupation is training through occupations. Calling cooperative education a "sleeping giant" American Vocational Association Executive Director, Lowell A. Burkett testified before the House of Representatives Subcommittee on Education that this concept of education has been present for a long time, but we have yet to institute it in the massive proportions that are needed.

The Chamber of Commerce of the United States, until a few years ago, held a rather aloof position toward vocational education. Spokesmen for the National Chamber, made a distinction between education and training, and called for broad general education rather than vocational training in schools. Apparently this earlier misconception has been clarified, for the Chamber now supports both, in an integrated whole.

Increasingly aware of the business community's stake in American social problems, the National Chamber of Commerce established a Task Force on economic growth and Opportunity in 1964. A result has been a series of scholarly investigations which deal with the problems of urban poverty, inner-city education, and the role of business in community affairs. One of the Chamber of Commerce publications, "What is the Responsibility of Business in Modernizing Education",

attests that responsibility for making education relevant to the living conditions, the economic opportunities, and the responsibilities of citizenship in a changing society is community-wide, and that failure to bring about the needed "revolution" can be blamed on the business community as well as educators:

> Subject matter academicians seldom collaborate with vocational teachers, and the false dichotomy between knowledge and the application of knowledge, the'knowers' and the 'doers', continues to divide both the courses and the personnel of education...
>
> Yet businessmen have seldom pressed boards of education, administrators or teachers to expand and improve guidance programs, work-study programs or on-the-job training, and thus build a prestige for functional education comparable to that of college preparatory courses. 5

Calling for much greater use of cooperative education for both teachers and students the Kerner Report on civil disorders gives eloquent testimony to the general low quality of education in ghetto schools. Specifically, the Kerner report recommends the building of new lines of communication between schools and the communities they serve by greatly expanding various work experience and other forms of cooperative programs for students, by expanding opportunities for community and parental participation in school affairs, and through intensive in-service training programs for teachers and pre-service experience for teacher candidates which are designed to bring both teachers and candidates into frequent and sustained contact with inner-city schools.

PART III THE EXCHANGE OF RESOURCE MATERIALS

Resource materials for vocational education, such as curriculum materials and curriculum laboratories, research and development centers, systems and strategies for teaching, and programs for the evaluation of student and teacher competencies, are among the high priority items cited by national advisory panels for vocational education. The 1962 Report of President Kennedy's Panel of Consultants, for example, recommended large unit curriculum laboratories, greatly expanded programs of vocational education research, and the improvement of teacher education. Since The Panel of Consultant's Report, a great amount of progress has been made, especially in the organization of national and state research agencies. But as reported by the 1968 Advisory Council on Vocational Education, a national plan for curriculum development and dissemination is still badly needed. When speaking of needed areas of service, the Advisory Council stated

that instructional materials are limited or nonexistent for many vocational education curriculums. Commercial publishers often cannot justify the development of materials because of limited numerical demand. Curriculums have not been developed for many of the newer occupational specialties, and local and state vocational education agencies have only developed curriculum and instructional materials for a limited number of programs.

When referring to the limited ability of many states and school districts to generate the capacity for appropriate curriculum development, the 1968 Advisory Council Report proposed that help from the federal government was essential. A national plan for coordinating the development of curriculums, courses of study, and instructional materials, requiring interstate and federal cooperation, was recommended.

Occupational Competency Testing

Among the limited number of reports discovered which relate to the development and exchange of vocational resource materials, the Griesse trade competency study and Larson's project to develop a model for a university Technology Resource Center have special significance to the realm of vocational teacher education.

Griesse's exchange of information study on the feasibility of providing trade competency examinations on a national basis calls attention to a persistant problem in vocational schoolwork. If the focus of vocational instruction is closely related to the preparation of students for occupational competency, what competency derived from occupational experience and training is needed on the part of teachers? Just what constitutes job-related competency to teach a vocational subject, and how may it best be measured?

The use of examinations to assess the proficiency of prospective trade and industrial teachers has long been common practice in some of the more populous industrial states, such as California, New York, Ohio and Pennsylvania. The majority of states, however, have no system of competency examination at all. Typically, the only assurance a school district or teacher certification agency can have concerning knowledge of occupational subject matter, when no objective test of knowledge and skill is made, is to measure a candidate's qualifications strictly by time -- the number of years employed in the occupation. As more states, community and technical colleges, and school districts seek out young and adaptable candidates for vocational teaching positions, and less reliance is given to "years spent in the occupation", the need for an adequate system for evaluating occupational competency will surely grow. One of the serious problems associated with occupational competency testing in the past has been the proliferation of state or local efforts

and the concomitant lack of national or even statewide norms. Judicious use of the computer should materially reduce this problem. Through the computerization of test item pools, it should be possible to constantly analyze, refine and update test items, as well as manufacture examinations for any specific purpose on short order.

Resource Center for the Preparation of Teachers

Whenever the quality of teachers and the teaching process are considered, the role and function of the teacher education institution is a vital concern. If the work of teachers in classroom or shop is to be materially strengthened, and if the strategies for combining educational media with differentiated staffs are to be adequately tested and developed, then it will be necessary for the institutions that prepare teachers to take the lead. There is much room for exemplary practice here. Schools of education need to look on their own activities with a much greater degree of objectivity -- to establish behavioral goals; to provide future teachers with opportunities to work in new environmental settings, with a variety of materials and devices; and to provide a focal point of communication between schools and industry, where the essential highlights of technological change may be constantly and quickly brought to teachers and students.

The Rutgers University project to develop a model for a Teacher Technology Center represents an important step in the movement toward the regeneration of vocational teacher education. Specifically, the Resource Center was planned to provide the ultimate in"innovations and advanced hardware", such as closed circuit TV and a data retrieval system. Designed in flexible modules of key instructional space, the plant is suitable for short and long time spans, lectures and conferences, and the combination of teacher learning with teacher teacher training.

Also designed for the development of modern curricula and mass media teaching materials, the research oriented resource complex provides for a library, a curriculum and evaluation center, and a materials reproduction area. At the present time, efforts are underway at Rutgers to bring together the necessary funds, from State, Federal, University and foundation sources, to make the conceptual design a functional reality.

PART IV OCCUPATIONAL INFORMATION EXCHANGE PROGRAMS

Time was when the vocational guidance counselor could, with some degree of security make periodic assessments of the local employment situation, and relating information thus obtained with regional and national trends obtained from published labor market estimates, transmit occupational information to students. Although the vocational guidance function continues to operate along these general lines, there is a growing cry for its complete overhaul. First, it is held to be far too slow and cumbersome to allow the counselor to keep abreast of modern technology. At about the time when he would have developed some level of knowledge about occupational information, all of his material is obsolete. Also, earlier concepts about the selection of proper clients for vocational counseling, generally identified as those persons labeled "non-college", are now undergoing a hard and abrasive reassessment. The counselor who assigns career goals to students, in conformity with the school's grouping system, and who can not see why all students are in need of occupational information and counseling may still be a common figure, but as the principle of career development penetrate the public schools, it may be expected that the more stratified and discriminatory forms of occupational counseling will fade into the background.

Use of the computer in occupational information retrieval is receiving wide attention. Major investigations are taking place at several campuses, including Harvard, University of Pittsburg, and Penn State. Other developments in information retrieval systems include the "View" approach employed in San Diego County, and Kunze's study of industry resources.

The "View" system of providing occupational information to students, reported by Glaeser in "School Shop", Smith in the "American Vocational Journal", and Pierson et al in "Vocational Guidance Quarterly", employs the use of microfilm aperature cards. Reporting that the work completed had concentrated on trade and technical occupations, Pierson spoke of the need for expanding the system to cover the total field of career information, with the next goal for the project the refinement of a storage and retrieval system.

Kunze's review of industry resources available to counselors relates that a communications block appears to exist between counselors and people in industry. Saying that counselors don't seem to know what questions to ask industrial people, and industrial people provide information so particularized that it is misleading, Kunze provides the

intelligence that industry is in the position to offer a variety of resources of occupational information data, which may be valuable to either counselors or to their student clients: (In order of Directness)

1. On the job tryout: part-time, summer jobs, work-study
2. Directed exploratory experiences: work samples, work evaluation tasks
3. Direct observation: visits to work settings
4. Synthetically created work environments: combination of stimuli and environmental manipulation
5. Simulated situations: career games, role play
6. Interviews with experts: questioning representatives of occupations, career days
7. Computer based systems: systems which store, retrieve and process occupational data in response to individual requests
8. Programmed instructional materials: books and workbooks
9. Audio-visual aids: films, tapes, slides, etc.
10. Publications: books, monographs, charts, etc. [6]

Computerized Informational Retrieval Systems

Impellitteri's study of computer assisted guidance at Penn State University seeks to develop an application of the computer which can serve as a high-powered resource of the guidance counselor. The objective of this system is to allow young people to broaden knowledge about the working world, and be able to identify appropriate opportunities for them in it.

Among other recent studies of computerized occupational information retrieval systems are ones conducted at Universities of Wisconsin, and Ohio State, and the exploratory study of information processing procedures and computerbased technology conducted by the Systems Development Corporation in Santa Monica, California. The University of Colorado 's analysis of methodology for projection of occupational trends in the Denver area, the U.S. Employment Service publication on a short-cut approach to long-range forecasting, and the Illinois RCU Computerized Vocational Information System are also relevant.

The University of Wisconsin Conference on Occupational Data Requirements held in June 1965 and reported by March revealed that at least two distinct schools of thought existed relative to the evaluation of occupational data and their use in occupational planning: One group felt that the need for occupational data is urgent. Their arguments were that information on labor demands is essential for the use of guidance services and as background for legislative measures and school planning.

On the other hand, an equally vocal group of conferees denied that increased efforts to provide occupational data would improve educational planning. Because of the weaknesses in the methodology of current occupational studies, and because of the difficulties inherent

in obtaining accurate information from employers on current and projected job vacancies, this group felt that further expansion of studies of occupational data would be a questionable investment of government funds.

The Ohio State research exchange conference on systems under development for vocational guidance was reported to be a unique experiment in research stimulation and coordination. Although the 21 researchers who participated felt they had just scratched the surface in identifying problems and issues, they did raise some important questions:

Model of Counseling Functioning - As the building of a system progresses, theoretical decisions have to be made as to how people make vocational choices, the role of diagnosis, amount of self direction. In building a model does the researcher operationally simulate observed counselor activities, or does he develop a new model?

Data Base Construction - What kinds of information will a system need in order to accomplish its goals?

Battery of Measurement Instruments - What kinds of information should be obtained through tests and which tests are most appropriate to measure appropriate traits?

Taxonomy of Occupations and Descriptions - This is basically a problem of how to classify and present educational and occupational information.

Other concerns expressed at the conference related to the monitering of systems by counselors and teachers; the influence that variations in educational settings and student populations would have; and the fundamental differences that exist between a taxonomy of occupations and a comprehensive examination of the world of work.

Cogswell's exploratory study of information processing procedures and computer-based technology in vocational counseling conducted for the systems development corporation, sought to conduct a system analysis of the counseling procedures employed at a selected field site; design and test a man-machine system; formulate and develop computer programs and collect initial evaluation data. A marked difference existed between what counselors are doing and what they would like to do, this study revealed. Ideally, counselors reported, they would like to change their activities in the humanistic direction of working more with students. However, when speaking about dangers of computer systems for guidance work, the report stressed three serious problems; Privacy of personal data; Misuse of predictive systems; and Alienation of humans subjected to computer processing.

The summary statements of Cogswell's study seems to have implications for the study of occupational information exchange, or any other phase of vocational counseling. Here the investigators say that despite our efforts to focus the design on the functions that both the men and the machine would play in the new system, it was found the major ideas that were developed in the design meetings were for the computer. Very little attention was given to what the counselor's role would be in the new system. Concern for the role of the human became more acute when analysis of data suggested that actual experience working as a guidance counselor in schools tend to increase the positive value placed on data manipulation. This observation caused the investigators to fear that once the computer is installed the counselors will use the extra time that would be gained to become more involved with data than with students.

PART V, ADVENTURES IN EXEMPLARY PRACTICE

The term exemplary connotes something which may serve as a pattern or model; deserving to be proposed for imitation; commendable. Clearly an exemplary practice is not of necessity new and innovative, or grand in scope or financial investment. While seeking to find direction and inspiration from the studies and actions of others, it occurred to me that exemplary practice begins at home. Something should be said for the unsung local effort of teacher or administrator, who's at the growing edge of educational progress. On this principle, I am here relating four operations with which I have been involved, and which appear to have some exemplary aspects. One report describes an administrative structure; another a major financial investment in leadership training; the third experience is with the AVA project to bring research information to typical journal readers; and the fourth item relates a personal experience in teaching, a twelve year adventure in individualized instruction.

Shared Time Education: A Vigorous Hybrid

The Lewis A. Wilson Area Center of Technology in Suffolk County New York represents a prototype, along with prestigious counterparts in Pennsylvania, Ohio and a number of other states, for the efficacy of shared-time education. Implicit in the rationale for a shared-time program is the concept that a truly comprehensive program of education, one which has a legitimate vocational component as well as a full spectrum of cultural and educational options for individuals, may indeed be made possible for allyoung people in all locations through cooperative arrangements between general high schools and area centers of technology and education.

Administered through a board of cooperative educational services, which is itself a shared-service operation, the Wilson Tech Center

serves 18 suburban high schools with over 20 vocational education programs. Students who attend the Area Center half of each school day are also enrolled in home high schools, where each may engage in any combination of social and educational activities.

Opened in 1963 with 200 students, Wilson Tech now has 1,200. Extensive construction now underway at its central campus location will provide for double the number of vocational programs and double the present enrollment. The new building design provides for a flexible allocation of student time in a variety of occupational clusters. Guidance, cooperative education, and graduate placement programs are integral parts of the Center's operation. Manpower programs and locally sponsored apprentice training, adult pre-employment and occupational extension classes are also provided by the area school.

Wilson Tech may be thought of as exemplary in the sense that it is a vigorous hybrid, combining some of the advantages of the full-time vocational school as well as benefits associated with the so-called comprehensive high school. At the time when Wilson Tech opened in 1963, there were about five other shared-time programs in operation throughout the state, mainly with limited enrollments in rented facilities. Today, there are over 50 such Area Centers of Technology for high school students, providing diversified vocational education opportunities in every region of the State. All of these programs, even the ones in the most sparcely populated sections of the Catskills and Adirondacks,are conducted on a shared-time basis.

Leadership Training Breakthrough in N.Y. State

A significant corollary to the dramatic expansion of new area vocational programs in New York has been the "Leadership Training Program". Conducted by State University College at Oswego, for a total of 45 administrative interns over a three year period, this bold adventure in management manpower was a vital ingredient in the rapid development of new Area Centers for it was the administrative trainees themselves who took a major responsibility in getting new schools into operation.

The first leadership training program began in the Spring of 1964 with about 15 trainees, and it was followed by two more sections of about the same size. Each group spent the better part of a year in the program. The three leadership training programs each had three main components: college instruction in a block of graduate courses relating to vocational education administration; an extended field visitation phase; and a period of supervised internship.

The field visitation phase of the leadership program was done on a large scale. Administrative trainees were flown to such widely

dispersed places as California, Manitoba, Georgia, Massachusetts and Wisconsin to meet with vocational education leaders and visit various kinds of vocational facilities. As the person in charge of the 1966-67 leadership training program, it was my privilege to conduct one of these international junkets, as well as teach the basic core of graduate classes and supervise the internship programs of 17 participants.

An essential fulcrum in the implementation of new vocational programs in areas of the State not previously served was the %100 subsidy of intern-director salaries. Without doubt, many of the local school boards would not have seen the urgency for having a multi-phase vocational program without such financial inducement.

In business and industry, the practice of making substantial financial investments in management training is commonplace. But for educators to spend over one million dollars on the training of 45 vocational administrators, there is no precedent and no parallel. The most exemplary aspect of the N.Y. Leadership program is not its unique combination of college, field visitation and internship, although these activities certainly had some commendable aspects, but rather, the blunt fact that educators, for once, had spent real money on a human investment!

Research Visibility

As interest in research has been stimulated in recent years, so also has the problem of getting fruits of research to school practitioners. Recognizing the need to provide some method of communication by which vocational educators, especially those outside of the community of research specialists, could know more about the nature and focus of vocational education research, the American Vocational Association proposed a synthesis and dissemination project to the U.S. Office of Education. The result has been "Research Visibility."

"Research Visibility," now in its second year, is a 16 page section which appears in each monthly edition of the American Vocational "Journal." Cooperatively financed by AVA and the U.S. Office of Education, the purpose of "Research Visibility" is to give national exposure to significant research; experimentation; demonstration and pilot programs; upgrading institutes, seminars and workshops; and other leaderhip development activities for teachers, supervisors, and administrators.

The organization of topics treated in Research Visibility was in its first year derived from the specific recommendations for change contained in the 1962 Panel of Consultants Report. One hundred and

forty-seven Reports, mainly of studies generated through Title 4(C) of P.L. 88:210, were treated. Each of the nine "Journal" editions for 1967-68 has approximately 15 to 20 reports. The nine main topics, used as a basis for the organization and review of materials are:

September	"High School Age Youth"
October	"People With Educational Needs Beyond High School"
November	"Youth With Special Needs"
December	"Youth And Adults Unemployed And At Work"
January	"Toward Teaching Excellence"
February	"Curriculum Development and Instructional Materials"
March	"Vocational Guidance"
April	"Leadership and Administration"
May	"Research and Evaluation"

A Twelve Year Adventure in Teaching

This report of a twelve year experience in individualized teaching is here given to illustrate a fundamental precept in education. The ultimate place for testing educational theory is where teachers meet students. Also proposed is the concept that teaching for individual learning is as fresh and innovative as the one-room school.

In this experience, efforts were made to give high school students, mainly 10th graders, who typically had no other courses in mathematics, an open-ended student-centered individualized program of instruction. The prevalent mode of teaching was supervised study, with students working independently toward achievement goals which each had established for himself. The experience began in 1950, and ended in 1962.

During a great part of this experience, the teacher was free of outside influence, either from the local administrators, the school's mathematics department, or the State Education Department. As the students were generally persons who were not considered capable or properly motivated for taking more "rigorous" math classes, and as the class satisfied the State's mandate for one unit of high school Math, all figures in the educational organization were content to leave the program completely in the hands of the teacher.

During the first week of school in September all students who appeared were tested with a combination of standardized general Math and teacher-made examinations. Students were advised that the class, usually of about 30 in size, represented a substantial range in Mathematics skill and comprehension - typically the groups ranged from about the 5th to the 80th percentile on national norms.

Students were asked to think of a classroom situation different from what they had usually experienced. There would be no body of subject matter that had to be mastered; no outside assignments; the teacher would not present a lesson, but rather once everyone was under way, he would move about the class helping individuals; the teacher would not correct papers - students would; the teacher would not help a student who could help himself - or who could be taught by another student; the teacher would not even determine what was satisfactory progress as student would do all that - based on goals that they set for themselves, subject to their own reappraisal throughout the year. In this vein, students even prepared, administered, corrected and recorded their own final examinations.

The multi-media materials for this open-ended math class were in the main standard vocational math textbooks - a considerable variety of them. Especially valuable were the ones which had been developed for Home study or apprentice training work.

The result of this experiment with individualized instruction improved over the years as did the style and resources of the teacher. Although the instructor did not have the foresight to carefully analyze and document the procedures employed and the results derived, there did appear to be a number of tangible benefits. The areas in which appreciable gains appeared to be made were in students' attitudes toward school as determined by school attendance, Mathematics skill, Mathematics comprehension, and Reading. In some cases, students improved over 50 percentile points in the course of a year. Another measure of success was in the number of "drop-ins" - students who graduated from "Shop Math" to College Prep or Technical Math courses during the year.

There is really nothing new about any part of this experience in individualized teaching. Every element of the process - from pre-testing to student participation in the articulation of behavioral and achievement goals to group process in the determination of the tone, tempo and focus of a class -- are well established precepts in the theory of pedagogy. But in this mechanistic age, when each day brings some new and often impersonal model for individualizing the instructional process it is good to keep in mind that the focal point of any system of education is where teachers and students meet in the shop or classroom.

PART VI SUMMARY AND HIGHLIGHTS

This narrative began with a review of the relationship that exists between Advisory Panel recommendations, together with other testimony, and the Law, the Vocational Education Amendments of 1968.

Attention was then directed to literature relating to exchange programs and projects having to do with personnel, with resource materials, and with occupational information. Also reported were four episodes taken from experience which appear to have some exemplary aspects. Highlights of the material treated, together with some tentative guidelines for further action are presented in the statements that follow.

1. The internship in education, although plagued with some administrative and operational problems, appears to be moving toward a position of general acceptance. A key to success in any internship appears to hinge on the question of its status in the university or certification program. Where it is a mandate, the internship is strong; where provided on a permissive basis, internship has generally failed to be effective.

2. There appears to be more talk than action regarding the exchange of personnel between different kinds of organizations. Many studies and articles support the idea of having better school industry and school government coordination, but the amount of hard information about the regular exchange of personnel on any permanent basis is negligible. Limiting factors for more effective school-industry cooperation are given as:

1. Fear of school administrators that industry groups will become special interest pressure groups.

2. Unwillingness by school administrators to provide special staff to work with industry; and

3. Confusion on the part of industry concerning how to effectively work with schools.

Another factor which has probably inhibited a more extensive movement of personnel from one organizational setting to another is the lack of safeguards or guidelines for the protection of employment status and employment benefits. With respect to this problem, Section 553 of the Vocational Education Amendments of 1968 contains the provision that federal funds may be used for exchange of vocational education teachers and other staff members with skilled technicians or supervisors in industry (including mutual arrangements for preserving employment and retirement status, and other employment benefits during the period of exchange). If significant progress is to take place in Personnel Exchange programs - there needs to be a dual commitment, that makes personnel exchange a regular part of each institution's operational design.

3. The Master Teacher Externship appears to be an idea which deserves more wide spread attention. In this program teachers who are in need of occupational upgrading receive college credit for appropriate employment experience. Such a provision breathes vitality

into the college of education curriculum by giving teachers the opportunity to learn by doing as a regular part of their program. Could not the externship plan also benefit the guidance counselors, curriculum coordinators and persons in administrative positions?

4. The role and function of State Departments of Education, are in a state of transition. According to Nyquist, there will be much less sovereignty and isolation, and a much greater degree of regional interstate and national cooperation. With a gradual relinquishment of "Territorial Imperatives" and a guarded but growing partnership with the Federal Government, a rising level of competence and a trend toward greater uniformity in all State Education Departments may be expected.

5. Cooperative Education, called "A Sleeping Giant" by Lowell A. Burkett, appears to be on the threshold of a major expansion in schools and colleges. The U.S. Chamber of Commerce endorsement of the work-study approach to education as well as its position that chamber members should take a more active part in school affairs should be an important stimulant.

6. The 1962 President's Advisory Panel recommendation for a greatly expanded program of vocational research has been to the establishment of National Research Centers and research coordinating units within states, but the widespread penetration of research findings and research thinking into the schools has yet to be achieved.

7. The 1962 Advisory Panel recommendation for large unit laboratories for the development and dissemination of curriculum materials for vocational education has yet to be achieved. According to the 1968 Advisory Council on Vocational Education, a national plan for coordinating the development of curriculum is still badly needed as instructional materials in some vocational fields are virtually nonexistent.

8. The use of occupational competency testing programs are now mainly determined by the capacity and commitment of State and Local institutions. Over half of the States have no organized program for producing and using competency examinations. As complete dependence on the "years in the occupation" measure of competence to teach an occupational subject becomes less widely employed, the value of having a computerized pool of test items and performance tasks for each occupational field will be increased.

9. The education of vocational education teachers continues in many colleges to fall far short of what is needed. The proposed

Teacher Technology Center at Rutgers, planned to provide the ultimate in innovative and advanced hardware and flexible space utilization, is designed to move vocational teacher education away from being a mere accumulation of courses. A national research and development commitment toward the improvement of teacher education seems to be needed.

10. The computer-assisted systems approach to occupational counseling is currently receiving a great amount of attention. Among the studies reported a number of rather fundamental problems were discussed. These problems relate to the efficacy of occupational data, the population of students to be served, the dangers inherent in matching students with jobs or in predicting future job success. Perhaps the most significant concern was found in Cogswell's exploratory study of information processing procedures in which the investigations found that the computer caused counselors to become more involved with data - than with students.

11. Shared-time for vocational instruction is reported as a vigorous hybrid, a system by which the well known advantages of full-time vocational schools and general high schools are combined to produce a comprehensive program of education. The Lewis A. Wilson Tech Center of Suffolk County, N.Y. is reported to be one of the prototype schools in N.Y. State from which a network of over 50 area centers of technology on a shared-time basis have been established. Comparative studies of shared time, "comprehensive", and full-time vocational schools, using cost-benefit analysis and other criterion measures may help dispel some of the myths and fantasies that now prevail.

12. The "Leadership Training Program" of N.Y. State is reported to be "A breakthrough in management power". Closely associated with the rapid development of over 50 new area centers of technology, the three year program to train 45 "instant administrators" is exemplary in the sense that educators have here made a major financial expenditure on a human ivestment.

13. "Research Visibility", the 16 page section appearing in each edition of the "American Vocational Journal", was designed to give the average reader -- the person typically not associated with research activities -- a chance to know more about the nature and scope of research. The main objective of this information exchange project has been to help bridge the gap that persists between research and practice in vocational education.

14. A personal accounting of a 12 year experience in individualized teaching is presented as a reminder that the essential ingredient for humanizing and individualizing the instructional process is the teacher. Although some research of supervised study techniques has been conducted, its special relevance to situations in cooperative and other forms of vocational education needs further investigation.

PATTERNS AND GUIDELINES FOR ADMINISTERING EXEMPLARY PROGRAMS AND PROJECTS AT THE STATE LEVEL

A Position Paper Prepared by

JOHN K. COSTER

Director, Center for Occupational Education

North Carolina State University at Raleigh

And Presented at

THE NATIONAL CONFERENCE ON EXEMPLARY PROGRAMS

Georgia State College

Atlanta, Georgia

March 14, 1968

PATTERNS AND GUIDELINES FOR ADMINISTERING EXEMPLARY

PROGRAMS AND PROJECTS AT THE STATE LEVEL

This paper is addressed to the problem of developing functional guidelines by and through which the provisions of Part D of the Vocational Education Amendments of 1968, entitled "Exemplary Programs and Projects," may be incorporated into the policies and plans of State Boards for Vocational Education. The problem merits attention to three major areas of concern:

1. The establishment of a basic posture of State level responsibility concerning exemplary programs and projects.

2. The establishment of an organizational and administrative structure for implementing the provisions of Part D of the Act at the State level.

3. The establishment of an exemplary program management and resource allocation system at the State level.

The Framework of State Responsibility

The 90th Congress, through Senate Report No. 1675, House Report No. 1532, and the Joint Conference Report, published as House Report No. 1938, set forth in broad, sweeping strokes its concerns for the development of occupational education programs designed to meet changing occupational demands and to serve all persons who need training or retraining for employment. These reports, and the Act itself, convey a sense of urgency about the changes needed to make occupational education more adaptive and responsive to the needs of American society and the American people. Of the several provisions included in the Vocational Education Amendments, none offers more promise for the future of occupational education than the exemplary programs and projects provision.

The purposes of Part D of the Act, as set forth in Section 141, ". . . are to stimulate, through Federal financial support, new ways to create a bridge between school and earning a living for the young people, who are still in school, who have left school either by graduation or by dropping out, or who are in postsecondary programs of vocational preparation, and to promote cooperation between public education and manpower agencies." To achieve these purposes, Congress has established a joint venture between State and Federal agencies to facilitate the development of new models for

occupational education. By allocating 50 per cent of the funds authorized under Part D of the Act to State Boards for Vocational Education, Congress (1) has made it possible for the States to participate more effectively in the development of new models of occupational education to resolve the array of problems which were identified in the Senate and House Reports, (2) has provided the opportunity for State personnel to exercise enlightened leadership and educational statesmanship in the resolution of problems and the development of new programs, (3) has provided the opportunity for the States to develop their plans for the implementation of this part of the Act in accordance with the priorities peculiar to a specific State, and (4) has disaggregated the total program so that the States can become an effective instrument in soliciting the efforts and energies of the best qualified professional personnel to attack the problems and evolve new solutions. Although the Act makes clear that National purposes and intent are to be served, it also provides that the States shall be responsible both for developing their own policies and plans for accepting and administering the program.

Obvious hazards exist in attempting to present a policy statement for adoption by all States in this paper. And no precise statement regarding the preparation of the section of the State Plan relative to exemplary programs and projects may be made until Federal guidelines for the development of such plans have been issued. This section of the paper is limited, therefore, (1) to setting forth basic considerations that should govern the development of a policy statement, and (2) to listing the minimum elements that should be considered in preparing the section of the State Plan relative to exemplary programs and projects.

The Development of a Policy Statement

It is suggested that each State Board for Vocational Education develop and adopt a policy statement relative to exemplary programs and projects and that consideration be given to including the following elements in the policy statement:

1. A statement of the acceptance of the concepts and principles of exemplary programs and projects.

2. A statement directing all persons engaged in occupational education in the State to encourage, facilitate, and assist in the development of exemplary programs designed to improve the quality and quantity of occupational education in the State. This statement would include an emphasis on making occupational education more accessible to all persons whose academic, socio-economic, and other handicaps prevent them from succeeding in regular programs of vocational education.

3. A statement designed to foster the creation of a climate for innovation within the program. Imagination is a quality highly prized in the development of exemplary programs. Thus, it is essential that such a climate be manifested in the policies of the State Board, the elements of the State Plan, the organization and administration of the program, and, finally, in coordinating the exemplary program with program development and operation.

4. A statement describing the nature of cooperative and coordinative linkages between those concerned with the exemplary programs and those concerned with program development, management, and operation.

5. A statement providing for the articulation between research and operational problems in vocational education. Such a provision would be consistent with the criticisms of research that have been mentioned in the report of the Advisory Council on Vocational Education, entitled Vocational Education: The Bridge Between Man and His Work, and in the Senate and House Reports. The Advisory Council's recommendation to establish exemplary programs and the Senate Report, referred to earlier, indicated that these programs should be developed that feature designs to synthesize the findings of research and related projects and incorporate these findings into new models of occupational education.

6. A statement providing that Federal funds available under Section 142(d) of the Act will not be commingled with State or local funds.

Elements of the State Plan

Preliminary attention may be given to the preparation of the section of the State Plan relative to exemplary programs and projects. It is reasonable to assume that the following elements should be included in the Plan:

1. The establishment of an Exemplary Program Advisory Council to formulate the State priorities for exemplary programs.

2. The designation of responsibility for the administration of funds made available under Part D of the Act, and the qualifications of persons who will be responsible for administering the programs.

3. The relationship of the office responsible for administration of exemplary programs to the State Division of Vocational Education.

4. The organizations, institutions, and agencies, including nonprofit public schools, that may participate in the program.

5. The system of coordinating efforts under the programs.

6. The system of contracting procedures for funding proposals.

7. The system of quality control developed to ensure work of high quality.

Organization and Administration

This section of the paper deals with the organizational and administrative structure in the State Division of Vocational Education for administering exemplary programs. More specifically, it relates to assigning the responsibility for administration, identifying the functions of the administrative body, and staffing the State office in charge of exemplary programs.

Responsibility for Administration

If research and related activity may be defined to include such activities as basic and applied research; developmental, experimental, pilot, and demonstration projects; and exemplary and innovative programs, as well as research utilization and dissemination; then it appears appropriate that one office be established within the structure of the State Division of Vocational Education to stimulate, coordinate, manage, and disseminate the products by these activities and incorporate them into existing programs of occupational education.

The preferred option for administering exemplary programs is to lodge this responsibility with the Research Coordinating Unit within the State. The option of establishing a new unit to manage the exemplary programs is rejected due to proliferation and redundancy. The Research Coordinating Units, which were formed initially in 1965, have been established as a viable mechanism for stimulating, coordinating, and interpreting research and related activity. Their mention in Part C of the Vocational Education Amendments of 1968 constitutes a congressional endorsement of the principle underlying their establishment and the effectiveness of their operation. Parenthetically, the preferred option for managing the State research program established under Section 131(b) of the Act is to lodge this responsibility with the Research Coordinating Unit.

The issue of the location of the Research Coordinating Unit may be raised in connection with the preferred option. Regardless of where they are located, the Units are established to serve the State Division of Vocational Education. When located outside of the administrative structure of the State

Division of Vocational Education, there is need for a coordinating or liaison officer to effect a working relation between the Unit and the State Division. The location of the State office in charge of exemplary programs should present no problem with regard to grant negotiation, since grants will be negotiated by a State fiscal officer upon recommendation by the State Board for Vocational Education or its designated officer regardless of where the State office in charge of exemplary programs is located.

Functions of the Administrative Office

Within the administrative structure established to implement the exemplary programs, four major functions may be identified which not only guide the operation of the program but also serve as the basis for staffing. These functions are listed as follows:

1. The priority determination function. The priority determination function relates to the need for a continual study to be made within each State to identify the problems confronting occupational education and to establish priorities for exemplary programs. The responsibility for this function should be assigned to the manager of exemplary programs. In addition, an Exemplary Program Advisory Council should be established by the State Board for Vocational Education, charged with the responsibility for assessing the problem areas of occupational education and with determining the priorities for exemplary programs subject to review by the State Board for Vocational Education. At least one member of the State Advisory Council on Vocational Education should be appointed to the Exemplary Program Advisory Council. Other members of the Exemplary Program Advisory Council should include the State Director of Vocational Education or his designee, the Director of the Research Coordinating Unit, and the representatives of local school units, teacher education staffs, counselor education staffs, and members of the business and industrial community.

2. The consultative function. The consultative function relates to providing consultation services to assist personnel from local school units, colleges and universities, nonprofit private agencies, and other organizations that are eligible to participate in the program in developing adequate proposals for exemplary programs, and, especially, in developing adequate plans for the evaluation of the programs. The purpose of the consultative function is to ensure that viable ideas for exemplary programs are not rejected due to the inability of the innovator to communicate clearly his ideas. The producer of ideas may not necessarily be an effective packager of ideas. This function is analogous to the stimulating function of the Research Coordinating Units. The consultative function establishes a link between the State office in charge of exemplary programs and the prospective innovator by providing a channel through which ideas may flow from the

innovator to the State office in charge of exemplary programs.

3. The management function. The management function involves the establishment of criteria for the evaluation of proposals; the reception, review, and disposition of proposals; and the requisite fiscal arrangements for implementation, as well as monitoring the programs that are created. The management function will be shared with the designated fiscal officer of the State. Where the Research Coordinating Units are independent of the State Division of Vocational Education, the management function may be shared by the designated officer of the Research Coordinating Unit and a liaison officer of the State Division of Vocational Education.

4. The coordination and actuation function. The coordination and actuation function relates to the coordination of projects in terms of the interrelationship among programs to produce a massive impact on problems identified in the priorities of the State and includes responsibility for seminars and training programs for directors of exemplary programs. It also relates to coordination between the Unit and the other sections of the State Division of Vocational Education and with local units. In addition, this function relates to the development of strategies for introducing the products of the exemplary programs into the mainstream of program development and operation within the State, as well as the development of strategies for dissemination.

Staffing the State Office in Charge of Exemplary Programs

Effective implementation of the provisions of Part D of the Act within the State is contingent upon the recruitment of a competent and qualified professional staff to perform the functions ennumerated above and the necessary supporting staff to provide research and clerical assistance. In addition, it will be necessary to establish a budget for the maintenance of the office for travel and for other costs.

If the preferred option for lodging the State office in charge of exemplary programs in the Research Coordinating Unit is accepted, then it seems logical for exemplary programs to be established and that these persons be assigned the responsibility for managing the State's exemplary program. The associate director in charge of exemplary programs should have the assistance of at least one full-time professional assistant, with the suggested title of Program Consultant. The minimum staff complement for the office would include at least one full-time secretary and one or two part-time research assistants plus the associate director and program consultant.

The associate director in charge of exemplary programs. The associate

director in charge of exemplary programs would be responsible for the performance of the priority determination and the management functions. In consultation with the State Director of Vocational Education and the director of the Research Coordinating Unit, he would be responsible for organizing the Exemplary Program Advisory Council and for the establishment and dissemination of priorities for the program. He also would be responsible for managing the program, including the recommendation of proposals for funding, the monitoring of progress of planning grants and exemplary programs, and for ascertaining that funded programs are progressing satisfactorily.

The minimum qualifications of the associate director are:

1. Hold the master's degree or equivalent and preferably the doctorate in occupational education or a related field.

2. Had a minimum of two years experience as a teacher, supervisor, or administrator.

3. Had experience as a director or co-director of a research or related project.

The program consultant. The program consultant would be responsible for the consultative and coordination and actuation functions. He would assume the initiative for establishing contact with persons in the State interested in planning exemplary programs, provide technical assistance in the preparation of applications for planning grants and the development of proposals for exemplary programs, and interpret the priorities and guidelines to persons interested in participating in the program. He also would assist in reviewing applications for planning grants and proposals for exemplary programs. Once the program is underway, he would assume responsibility for coordinating the exemplary program with other programs in the State Division of Vocational Education and with other agencies. He also would be responsible for developing strategies for disseminating the results of the exemplary programs and for introducing the results into the operational programs of occupational education in the State in cooperation with professional personnel in the State Division of Vocational Education.

The minimum qualifications of the Program Consultant are:

1. Hold the master's degree or equivalent and preferably the doctorate in occupational education or a related field and have had formal training in the design and evaluation of research projects.

2. Have a minimum of two years of experience in education, research, developmental work, or related fields.

3. Had experience in conducting a research or related project, either as a director or as a research associate, preferably in projects closely related to exemplary programs.

Exemplary Program Management and Resource Allocation System

The ultimate effectiveness of the State's exemplary program is based on (1) the establishment of a channel through which personnel who conceive of ideas for exemplary programs may communicate these ideas to the State office in charge of exemplary programs, (2) assessing the practicality, potential value, or feasibility of the idea, (3) developing an adequate proposal as the vehicle for bringing the idea into fruitation, (4) conducting the program so that the idea is translated into a model for improving the quality and quantity of occupational education in the State, and (5) incorporating the results of the exemplary program into operational programs of occupational education.

The consultative function of the State office in charge of exemplary programs provides for informal lines of communications between innovators and the office. This provision enables prospective initiators of exemplary programs to obtain a hearing with regard to the feasibility of ideas in terms of their potential relevance to the priorities of the State. Prospective initiators should be encouraged to submit brief synopses of ideas for exemplary programs to the office for review and reaction. In the operation and implementation of the program, however, a more formal system of communication of ideas and management of resources is needed.

This section of the paper presents a system for managing the State's exemplary programs and allocating resources available to the State to these programs. Two assumptions underlie the Exemplary Program Management and Resource Allocation System described herein:

1. The Federal funds that are made available to States under the provisions of Section 142(d) of the Vocational Education Amendments of 1968 are to be managed as scarce resources, so that it is imperative that the management system direct these resources toward problems of high priority.

2. The management of resources for exemplary programs dictates that quality control procedures be instituted. These procedures would provide for periodic reviews of progress and for the termination of programs whenever satisfactory progress has not been made.

The Exemplary Program Management and Resource Allocation System is based in part on the conditions of grants expressed in Section 143 of the

Act. According to this section, grants may be provided to fund all or part of the cost of (1) planning and developing exemplary programs, and (2) establishing, operating, or evaluating exemplary programs. This system provides for the initiation of proposals, the development of proposals under a planning grant, review of proposals, the monitoring of grants, the termination of programs, and the introduction of the products of the programs into the operational programs of occupational education.

The system, shown schematically in Figure 1, is divided into two subsystems: the exemplary program conception, feasibility, and development subsystem; and the exemplary program actuation and execution subsystem.

Exemplary Program Conception, Feasibility, and Development Subsystem

The exemplary program conception, feasibility, and development subsystem provides for (1) the receiving of applications for planning grants, (2) the evaluation and disposition of these applications, (3) the approval and funding of planning grants, (4) the monitoring of progress of the grants, (5) the receiving of proposals for exemplary programs, (6) the evaluation and disposition of these proposals, and (7) the funding of exemplary programs.

The subsystem is divided into two phases. Phase I involves receiving and disposing of applications for planning grants. A suggested guideline for submitting applications for these grants is attached to this paper as Appendix A. The application requests the following information:

1. The problem to which the proposed exemplary program is addressed and its relation to the priority areas for the State.

2. The objectives of the program, expressed in terms of the product to be produced at the termination of the project.

3. A brief description of activities and procedures proposed for conducting the exemplary program.

4. A brief description of activities in which the initiator plans to engage during the planning period.

5. The qualifications of the personnel who will direct the program.

6. An estimate of the cost required to plan or develop the proposal for the exemplary program.

The application will be submitted to the State office in charge of

EXEMPLARY PROGRAM MANAGEMENT AND RESOURCE ALLOCATION SYSTEM

FIGURE 1

exemplary programs. After initial screening for completeness, the application will be referred to an ad hoc review panel of three or more members for evaluation and recommendations. Suggested criteria for evaluating applications for planning grants are attached to this paper as Appendix B. The options to the members of the review panel are (1) approval, (2) provisional approval with specific recommendations for revision, and (3) disapproval. Applications that are provisionally approved by the review panel may be approved by the manager of exemplary programs if the recommendations are fulfilled. If the application is approved, then a recommendation for awarding a grant to the contracting organization will be made to the State Board for Vocational Education or to the officer designated to give financial approval and authorize the issuance of a grant. The planning grant then will be negotiated by a State fiscal officer.

Phase II of the subsystem pertains to the preparation of the proposal for the exemplary program. It provides for the monitoring of the planning grant to ensure that satisfactory progress is being made toward the development of an exemplary program and requires quarterly progress reports. The management procedures include an option for terminating the planning grant where there is lack of evidence of satisfactory progress. The termination of a grant should be an action of the last resort, but it should be an option open to the manager of the exemplary programs. The suggested termination procedures are:

1. A conference of the State exemplary program manager, the program director, and the appropriate officer of the applicant organization will be held to discuss the evidence of lack of satisfactory progress toward the planning of the exemplary programs.

2. The results of the conference will be reported to the Exemplary Program Advisory Council, together with a recommendation for termination.

3. Subject to concurrence of the Exemplary Program Advisory Council, a recommendation for termination will be submitted to the State Board for Vocational Education or its designated officer.

4. Subject to the acceptance of the recommendation for termination, the State Board for Vocational Education or its designated officer shall instruct the State fiscal officer to terminate the grant and suspend payment of additional funds.

The end product of the planning grant is a proposal for an exemplary program. Suggested guidelines for the preparation of exemplary programs and projects are included in this paper as Appendix C. These guidelines require that information be provided relative to:

1. The specification of the exemplary program, including the definition of the problem area toward which the program is directed, a description of the program, the rationale on which the program is based, and the objectives of the program stated in terms of the product to be produced at the termination of the program.

2. The activities and procedures to be undertaken, including the overall plan or design, the setting in which the exemplary program will be conducted, the participants in the program, and the organization and administrative arrangements.

3. The proposed plan for evaluating the effectiveness of the exemplary program in light of the objectives of the program, including the evidence that will be obtained to demonstrate the efficacy of the model, how the evidence will be obtained, and how it will be analyzed and presented.

4. The plan for introducing the results of the program into the operational structure of the applicant organization, the plan for demonstrating the products of the program, and the plan for disseminating the results in addition to the final report and publication of results in periodicals and journals.

5. A time schedule for indicating the estimated dates for completing major events occurring in the program, such as the completion of the preparation of preliminary drafts of instructional materials, the completion of field testing, or the completion of the preparation of the preliminary draft of the final report.

6. A plan of financing the program prepared as a budget to support the request for funds, subdivided by major categories such as personnel, travel, supplies, and communications.

The completed proposal will be submitted to the office in charge of exemplary programs. Proposals will be screened initially by the members of the professional staff of the office for completeness. If the proposal is complete, it will be referred to the review panel for evaluation and recommendations. The procedures for disposing of proposals for exemplary programs are the same as the ones given earlier for the application for planning grants.

Exemplary Program Actuation and Execution Subsystem

The exemplary program actuation and execution subsystem provides for the management of exemplary programs from the point of time when the grant award is made through the publication of the final report to the adoption and implementation of the new model developed pursuant to the provisions of

1. The specification of the exemplary program, including the definition of the problem area toward which the program is directed, a description of the program, the rationale on which the program is based, and the objectives of the program stated in terms of the product to be produced at the termination of the program.

2. The activities and procedures to be undertaken, including the overall plan or design, the setting in which the exemplary program will be conducted, the participants in the program, and the organization and administrative arrangements.

3. The proposed plan for evaluating the effectiveness of the exemplary program in light of the objectives of the program, including the evidence that will be obtained to demonstrate the efficacy of the model, how the evidence will be obtained, and how it will be analyzed and presented.

4. The plan for introducing the results of the program into the operational structure of the applicant organization, the plan for demonstrating the products of the program, and the plan for disseminating the results in addition to the final report and publication of results in periodicals and journals.

5. A time schedule for indicating the estimated dates for completing major events occurring in the program, such as the completion of the preparation of preliminary drafts of instructional materials, the completion of field testing, or the completion of the preparation of the preliminary draft of the final report.

6. A plan of financing the program prepared as a budget to support the request for funds, subdivided by major categories such as personnel, travel, supplies, and communications.

The completed proposal will be submitted to the office in charge of exemplary programs. Proposals will be screened initially by the members of the professional staff of the office for completeness. If the proposal is complete, it will be referred to the review panel for evaluation and recommendations. The procedures for disposing of proposals for exemplary programs are the same as the ones given earlier for the application for planning grants.

Exemplary Program Actuation and Execution Subsystem

The exemplary program actuation and execution subsystem provides for the management of exemplary programs from the point of time when the grant award is made through the publication of the final report to the adoption and implementation of the new model developed pursuant to the provisions of

Summary

The Vocational Education Amendments of 1968 provide for States to participate in the process of reshaping occupational education by making available Federal funds through authorization of Part D of the Act to State Boards of Vocational Education to finance exemplary programs and projects selected by the State Board or its designated agency. The opportunities for the States to participate in the venture necessitates that the States accept the implied responsibility for encouraging the development of new models of occupational education and to adopt the necessary policies and develop the appropriate sections in the State plan to govern the activities in the States. Special emphasis is placed on creating a climate for innovation in the State and on utilizing the products of research and related projects in planning, developing, and executing exemplary programs.

In addition to accepting the provisions of the Act relating to exemplary programs, it is necessary for the State Board for Vocational Education to establish a State office in charge of exemplary programs. The preferred option is to lodge the State office in charge of exemplary programs within the State's Research Coordinating Unit. The office, to be headed by an associate director of the Research Coordinating Unit in charge of exemplary programs, is assigned four functions, including a priority determination function, a consultative function, a management function, and a coordination and actuation function. The importance of adequate staffing of the office and adequate budgeting for operational expenses is stressed. It is recommended that an Exemplary Program Advisory Council be established by authority of the State Board for Vocational Education to make a continual assessment of the long-range operational problems of the State and to establish priorities for exemplary programs.

An Exemplary Program Management and Resource Allocation System is presented in the body of the paper which details a systematic approach to soliciting, receiving, evaluating, funding, and monitoring planning grants and fully developed proposals for exemplary programs. The system is designed to facilitate the submission and review process, to provide for the allocation of resources, and to provide for quality control of the work to be undertaken with options of terminating programs whenever there is lack of evidence of satisfactory progress. The system also provides for the dissemination of results and for incorporating the results of the programs into operational programs of occupational education.

APPENDIX A

GUIDELINES FOR SUBMITTING AN APPLICATION FOR A PLANNING GRANT FOR DEVELOPING AN EXEMPLARY PROGRAM OR PROJECT

I. COVER PAGE

APPLICATION FOR A PLANNING GRANT TO DEVELOP AN EXEMPLARY PROGRAM OR PROJECT SUBMITTED TO THE STATE BOARD FOR VOCATIONAL EDUCATION UNDER THE AUTHORITY OF SECTION 142(d) OF THE VOCATIONAL EDUCATION AMENDMENTS OF 1968, P. L. 90-576

TITLE OF PROGRAM:	(Be concise; avoid technical terms)
APPLICANT ORGANIZATION:	(Name and address of College or University, School District, Nonprofit Private Agency, or other unit.)
INITIATED BY:	Signature (Full name of person responsible for developing the application; position; telephone area code, number, and extension.)
PROGRAM DIRECTOR:	Signature (Full name of person in charge of the planning grant; position; telephone area code, number, and extension.)
CERTIFICATION OF COMPLIANCE:	I certify that an Assurance of Compliance with Title VI of the Civil Rights Act of 1964 has been filed with the U. S. Department of Health, Education and Welfare, and that it applies to this application for a planning grant.
CERTIFICATION OF NEED:	I certify that funds are not available for the application organization to develop a proposal for the exemplary program described in this application.
TRANSMITTED BY:	Signature (Full name and position of person committing the applicant organization to the planning grant; telephone area code, number, and extension.)
DURATION OF PLANNING GRANT:	(Proposed beginning and ending dates)
TOTAL FUNDS REQUESTED:	
DATE TRANSMITTED:	

II. THE APPLICATION FOR THE PLANNING GRANT

The purpose of the planning grant is to provide funds to qualified applicant organizations to pay the cost of developing a viable proposal for an exemplary program or project. Funds may be requested to pay the salaries of personnel who are released from their regular assignments in the applicant organization to develop an adequate proposal for an exemplary program. Funds also may be requested to pay travel costs and other expenses incurred in the preparation of the proposal. Applicant organizations must certify that funds are not available locally to develop the proposal for the program described in the application for the planning grant.

The application is an instrument for the communication of an idea for an exemplary program. In the application, the initiator is requested to describe the idea, define the problem area to which it is related, indicate the relation of the problem area to the State priorities for exemplary programs, state briefly the objectives of the program in terms of the product to be produced at the termination of the program, describe briefly how the program will be conducted, indicate the activities to be undertaken during the period covered by the planning, state the qualifications of the program director, and provide an estimate of cost for preparing the proposal.

Information regarding each of the following points should be included in the application for the planning grant.

Problem Area: State briefly the problem area to which the proposed exemplary program is addressed, describe briefly the exemplary program, indicate the target population, justify the significance of the proposed program in terms of State priorities for exemplary programs, and delineate briefly the exemplary features of the idea.

Objectives: The objectives of the exemplary program should be stated in terms of the product to be produced at the termination of the program, insofar as this is possible in the initial planning stage. The end product may be a new curriculum, a new structure for occupational education in a local school, or a system for introducing occupational education into elementary schools.

Description of Activities and Procedures: Describe briefly how and where the program will be conducted, and the procedures that will be employed in conducting the program.

Description of Activities During the Planning Period: Describe briefly the activities in which the program director will engage in the development of the proposal for an exemplary program, during the period covered by the planning grant.

Personnel: Provide a brief resume of the qualifications of the person(s) who will be responsible for planning the program, and indicate special qualifications and experience which should be considered in evaluating the application.

Budget: Submit an estimate of costs requested to plan the proposal for the exemplary program, and attach to the application a brief statement to justify the funds requested. Budgets will be negotiated by a state fiscal officer, subject to recommendations of the review panel and in consultation with the initiation of the application.

Start the budget on a separate page, and follow the format shown on the budget worksheet.

BUDGET WORKSHEET FOR APPLICATIONS FOR PLANNING GRANTS

Initiator_____ Duration of Proposed Program_____

Institution or Agency_____ Beginning Date_____ Ending Date_____

Category	Project Costs by Line Items	
	State-Federal	Local
I. DIRECT COSTS A. Personnel (List all position titles such as program director, secretary, consultants*, etc. State percent of time on program, per annum salary, and beginning and ending dates for each person.)		
B. Employee Benefits (Summarize benefits such as Social Security, Retirement, etc.)		
C. Travel (Indicate fares and/or mileage at allowable rates; number of days per diem* and rate.)		
D. Supplies and Materials (Give costs for office supplies.)		
E. Communications		
F. Services (Give costs for duplication and other services required in the development of the exemplary program.)		
G. Final Report Costs	N/A	N/A
H. Equipment	N/A	N/A
I. Other Direct Costs (List and justify)		
J. Subtotal, Direct Costs		
II. INDIRECT COSTS (Give basis on which local overhead is computed, who established the rate, when, and period covered.)		
III. TOTAL COSTS		
IV. COST SHARING (Give per cent)		

*Consultants: Show rate and number of days under Personnel; transportation and per diem under Travel.

APPENDIX B

SUGGESTED CRITERIA AND PROPOSED FORM FOR EVALUATING APPLICATIONS FOR PLANNING GRANTS TO DEVELOP EXEMPLARY PROGRAMS OR PROJECTS

SUGGESTED CRITERIA AND PROPOSED FORM FOR EVALUATING APPLICATIONS

FOR PLANNING GRANTS TO DEVELOP EXEMPLARY PROGRAMS OR PROJECTS

Title of Program_____

_____

Initiator_____

Title or Position_____

Applicant Organization_____

The criteria to be considered in evaluating the application of the planning grant are listed under the categories of significance and relevance, activities and plans, personnel, and economic efficiency. Review panel members are requested to indicate whether each criterion is judged to be satisfactory, and to comment briefly (attach additional sheets) on the adequacy of the application relative to each category.

Significance and Relevance	Yes	No
1. The application is addressed to a significant problem area that is relevant to the State priorities for exemplary programs.	___	___
2. The idea for the exemplary program described in the application has promise for developing new models for occupational education in the State.	___	___
Activities and Plans		
3. The overall plan presented in the application merits support for a planning grant.	___	___
4. The activities in which the initiator proposes to engage during the planning period are designed to produce an adequate proposal for an exemplary program.	___	___

Personnel	Yes	No
5. The personnel are qualified to plan the exemplary program based on evidence of training and experience.	___	___
Economic Efficiency		
6. The costs for planning the exemplary program are reasonable and justifiable.	___	___
7. The ratio of costs to probable outcomes is satisfactory.	___	___

Recommendation (Check one)

_____Approval

_____Provisional approval. State the provisions (attach additional sheets) to be satisfied by the initiator in order for the application to be approved.

_____Disapproval

APPLICANT ORGANIZATION:	(Name and address of College or University, School District, Nonprofit Private Agency, or other unit.)
INITIATED BY:	Signature (Full name of person responsible for developing the proposal; position; telephone area code, number, extension.)
PROGRAM DIRECTOR:	Signature (Full name of person in charge of the program; position; telephone area code, number, extension.)
CERTIFICATION:	I certify that an Assurance of Compliance with Title VI of the Civil Rights Act of 1964 has been filed with the U. S. Department of Health, Education, and Welfare, and that it applies to this program proposal.
TRANSMITTED BY:	Signature (Full name and position of person committing the applicant organization to the program; telephone area code, number, extension.)
DURATION OF PROGRAM:	(Proposed beginning and ending dates)
TOTAL FUNDS REQUESTED:	$_____for first year $_____for duration of program
DATE TRANSMITTED:	

II. ABSTRACT

Starting on a separate sheet, provide a one-page abstract of the program. Insert the abstract immediately following the cover page. Provide the following information:

Title of Program:

Program Director:

Applicant Organization:

Total Funds Requested:

Beginning Date:_____ Ending Date:_____

Objectives: State briefly the purpose, objectives, or nature of the program and indicate briefly the principal exemplary feature of the program.

Activities or Procedures: Give a brief description of the overall design or plan of the program.

Expected Contribution to Developing New Models of Occupational Education: Indicate briefly how the proposed program will contribute to the improvement of the quality and quantity of occupational education, and its implications for developing new programs in the State, or for extending and expanding occupational education to persons not currently being adequately served.

III. THE BODY OF THE PROPOSAL

The proposal is an instrument of communication of intent and commitment. In the body of the proposal, the initiator is expected to indicate clearly the nature and scope of the exemplary program or project which he purports to conduct, to relate the program to the problem(s) or conditions that generate the needs of a new addressment to existing programs and conditions, to describe and synthesize the products of research and related programs that are to be incorporated in the exemplary program, to specify the objectives of the program, to describe how, when, and where the program is to be conducted, to describe how the program is to be evaluated, to indicate how the product of the program is to be implemented, and to prepare an estimate of the cost for conducting the program.

The subheadings under the guidelines define the information desired for an adequate appraisal of the proposed program. Appropriate information should be presented under each major section of the body of the proposal; however, within a section, the initiator is free to present the information in the manner that will enable him to communicate most effectively and forcibly with the persons who will be responsible for reviewing and evaluating the proposal.

Specification of the Program or Project

This section of the proposal indicates why the program or project should be undertaken. It begins with a definition of the problem area, includes the description of the proposed program or project, presents a rationale underlying the program, and concludes with a statement of the objectives of the program expressed in terms of the product resultant at the termination of the project.

Problem Area

State and delineate the problem, complex of problems or area(s) of concern toward which the program is directed and relate the problem area to the priorities for exemplary programs in the State and to the need to develop new models for occupational education. Present background information relevant to the problem and cite references and data which support the significance of the problem. Describe the target population, where appropriate.

Program or Project Description

Describe the proposed program or project in sufficient detail to indicate (1) the nature and scope of the program or project, (2) the exemplary features of the program, (3) the potential impact of the program toward improving the quality and quantity of occupational education in the State, (4) the feasibility of the program in terms of potential adoption into the state program of occupational education, (5) the potential contribution of the program toward resolving the problem area or areas of concern defined in the preceeding subsection, and (6) the justification for requesting Federal and State funds to conduct the program.

Rationale

State the operational framework or rationale that buttresses the proposed program. Present a review and summary of the findings and products of research and related programs and projects which form the basis for the proposed program, and demonstrate how the products of these programs and projects will be introduced into the program described in the preceeding subsection.

Objective(s)

State the objective(s) of the program in terms of the product--i.e., new curriculum, organizational models, new work experience programs--to be produced at the termination of the program, and delineate the objectives to the extent that the delineation may serve as a guide to the design or plan of the program and for evaluating the efficacy of the program.

Activities and Procedures

This section of the proposal indicates what is to be done: how the proposed exemplary program or project is to be conducted. It provides information regarding the design or plan of the program, the setting in which the program will be conducted, the participants in the program, and organizational and administrative arrangements for conducting the program.

Overall Design or Plan

Describe the overall design or plan for the program in sufficient detail to demonstrate clearly that the design or plan is appropriate for attaining the objectives set forth in the preceeding section. Justify the design or plan in terms of its appropriateness for attaining the objectives. Where appropriate, indicate options for alternative courses of action that may be employed if the need arises.

The Setting

Describe the setting in which the exemplary program will be conducted, including such information as the communities, schools, or classes which will be used in conducting the program; the appropriateness of the

units for conducting the program; and demographic characteristics of the communities, schools, or classes which may be useful in assessing the appropriateness of the setting.

Participants

Describe the participants in the programs in terms of the special or unique features of the program and the criteria for their selection. For example, in a curriculum development program or in a work experience program, describe the characteristics of the students who will serve as subjects in the development and testing of the program.

Organizational and Administrative Arrangements

Describe the organizational and administrative structure for conducting the program. Indicate the relationship between the proposed program staff and local administrators, supervisors, teachers, guidance counselors, community personnel, and advisory committees. Indicate the commitment of the local administrative unit--university, college, community college or technical institute, or local school unit--in conducting the program. Describe special cooperative arrangements with other agencies, institutions, or the business and industrial community.

Evaluation

This section of the proposal presents the plans or strategies for evaluating the program in light of the stated objectives. It indicates that evidence which is to be submitted to demonstrate the objectives have been attained, how the evidence is to be collected, the instrumentation and data collecting instruments to be used, and the proposed method of analyzing the data. Where the programs involve field testing, the description should include information regarding the base line data to be collected for evaluation and/or the use of experimental and control groups in the evaluation process. The evaluation should provide for assessing the appropriateness of the process of developing the exemplary program as well as for assessing the product of the program.

Utilization and Dissemination

This section of the proposal indicates the plans for incorporating the results of the exemplary program into the operational framework of the applicant organization, and the plans for disseminating the results of the program.

Utilization

Describe the plans for incorporating the results of the exemplary program into the operational framework of the application organization or consortium of units participating in the exemplary program. Indicate briefly the feasibility and practicality of the exemplary features of the program, and provide evidence that the applicant organization is willing to finance the program once the program has been terminated.

Dissemination

Describe the plans for disseminating the results of the program, in addition to traditional methods of dissemination such as the preparation of a final report or the preparation of articles for periodicals. Give particular attention to making provisions for demonstrations of the exemplary features of the program during the process of the program, and for seminars, conferences, and workshops to be conducted when the program has been completed.

Time Schedule

This section of the proposal presents a time schedule for the completion of the major events in conducting the program.

Personnel and Facilities

This section of the proposal presents information regarding the qualifications of the personnel who will conduct the program and the availability of adequate facilities for conducting the program.

Personnel

List the names, titles, and a brief statement of the pertinent experience and unique qualifications of the personnel who will conduct the program, especially the program director. List the names and qualifications of consultants whenever possible. Indicate whether the key personnel and consultants have agreed to serve on the program.

Facilities

Indicate any special facilities available which will enhance the successful completion of the program.

The Budget

This section of the proposal presents the proposed plan for financing the program. The budget should be prepared for the duration of the program subdivided according to fiscal years beginning July 1 and ending on June 30. Programs are limited to three years duration, but a program may encompass four fiscal years. Budgets will be negotiated by a state fiscal officer, subject to recommendations by the Review Panel and in consultation with the initiator of the program.

The budget worksheet provides for local cost sharing of the costs of the program, and local contributions should be shown regardless of the policy of the State Board for Vocational Education to require local contributions.

Start the budget on a separate page, and follow the format shown in the budget worksheet. Attach additional sheets where needed to explain unusual costs of the program.

BUDGET WORKSHEET FOR EXEMPLARY PROGRAMS

Initiator_____ Duration of Proposed Program_____

Institution or Agency_____ Beginning Date_____ Ending Date_____

Project Costs by Line Items

Category	First Year		Second Year		Third Year		Total	
	State-Federal	Local	State-Federal	Local	State-Federal	Local	State-Federal	Local
I. DIRECT COSTS A. Personnel (List all position titles such as program director, secretary, research assistants, consultants*, etc. State per cent of time on program, per annum salary, and beginning and ending dates of employment for each person.)								
B. Employee Benefits (Summarize benefits such as Social Security, retirement, etc.								
C. Travel (Indicate fares and/or mileage at allowable rates; number of days per diem* and rate.)								
D. Supplies and Materials 1. Project Materials 2. Office Supplies								
E. Communications								
F. Services 1. Duplication 2. Statistical 3. Testing 4. Other								
G. Final Report Costs								
H. Equipment (Where allowable)								
I. Other Direct Costs (List)								
J. Subtotal, Direct Costs								
II. INDIRECT COSTS (Give basis on which local overhead is computed, who established the rate, when, and period covered.)								
III. TOTAL COSTS								
IV. COST SHARING (Give per cent)								

*Consultants: Show rate and number of days under Personnel; transportation and per diem under Travel.

APPENDIX D

SUGGESTED CRITERIA AND PROPOSED FORM FOR EVALUATING PROPOSALS FOR EXEMPLARY PROGRAMS AND PROJECTS

SUGGESTED CRITERIA AND PROPOSED FORM FOR EVALUATING

PROPOSALS FOR EXEMPLARY PROGRAMS AND PROJECTS

Title of Program _____

_____

Initiator _____

Title or Position _____

Applicant Organization _____

The criteria to be considered in evaluating the proposal for an exemplary program are listed under the categories of significance and relevance, activities and plans, utilization, personnel and facilities, and economic efficiency. Review panel members are requested to indicate whether each criterion is judged to be satisfactory, and to comment briefly (attach additional sheets) on the adequacy of the proposal relative to each category.

Significance and Relevance	Yes	No
1. The proposal is addressed to a significant problem area that is relevant to the State priorities for exemplary programs.	___	___
2. The idea for the exemplary program described in the proposal has promise for developing new models for occupational education in the State.	___	___
Activities and Plans		
3. The problem area and the objectives are clearly defined and the objectives are stated in a manner to facilitate the evaluation of the program.	___	___

Activities and Plans (Continued)	Yes	No
4. The rationale on which the program is based is sound, adequately developed and the products of research and related activities on which the program is based are adequately delineated, synthesized, and relevant to the proposed program.	___	___
5. The procedures necessary to attain the objectives are appropriate and technically sound.	___	___
6. The working arrangements, denoted in the setting, the participants, and the organizational and administrative arrangements, are conducive to attaining the objectives of the program.	___	___
7. The plan of evaluation is complete, technically sound and the analytical procedures are appropriate for the evaluation.	___	___
Utilization		
8. The proposal clearly indicates the feasibility of utilizing the results of the program in improving the quality and quantity of occupational education.	___	___
9. The proposal clearly indicates that the applicant organization is committed to introducing the results of the program into its operational program.	___	___
10. The plans for disseminating the results of the program and for demonstrating the exemplary features of the program are adequate.	___	___
Personnel and Facilities		
11. The personnel assigned to the program are qualified to conduct the program.	___	___

Personnel and Facilities (Continued)	Yes	No
12. The proposal provides for the use of professional personnel outside the field of education where appropriate.	___	___
13. The facilities for carrying out the program are adequate.	___	___
14. The nature of the cooperation for participating schools or other agencies is clearly identified, and adequate evidence of committment is presented.	___	___
Economic Efficiency		
15. The costs for conducting the program are reasonable and justifiable.	___	___
16. The ratio of costs to probable outcome is satisfactory.	___	___

Recommendations (Check one)

_____ Approval

_____ Provisional approval. State the provisions (attach additional sheets) to be satisfied by the initiator in order for the proposal to be approved.

_____ Disapproval

STRATEGIES FOR IMPLEMENTING EXEMPLARY PROGRAMS AND PROJECTS IN ORDER TO MAKE MAXIMUM CHANGE IN THE EDUCATIONAL PROCESS

Samuel A. Moore, II
Michigan State University

It is both ironic and understandable that vocational educators are concerned with strategies for implementing change. It is ironic because vocational educators, particularly those concerned with changing agricultural techniques, have had dramatic success with invoking change. Too, they have been in the forefront in conducting research into the change process. But is it not also understandable that they should be concerned? The very fact that change has been wrought suggests that those who have been most successful would also be most sensitive to the problems of change -- particularly the problems associated with implanting changes which make a desired difference.

While it has become trite to say it -- nothing is more inevitable than change. Whether evolutionary or revolutionary, change will occur -- it does occur. The main problem for the educator has been one of selecting or generating desired changes and then implementing them in such a manner that they have maximum impact on the educational scene. And it is here that one finds the heart of Exemplary Programs and Projects. It is extremely important that one keep in mind the purpose of Exemplary Programs and Projects -- "... to stimulate, through Federal financial support, new ways to create a bridge between school and earning a living for young people, who are still in school, who have left school either by graduation or by dropping out, or who are in postsecondary programs of vocational preparation, and to promote cooperation between public education and manpower agencies."

Purpose is critically important since our broadly based educational program is conceived to meet many purposes. If the Exemplary Programs and Projects are to keep faith with the intent of the 1968 Amendments, they must demonstrably fulfill the purpose set in the legislation. Grant that there may be peripheral and spin-off gains which have great import for our broad educational program -- but, if the specific intent of the Amendments is not realized, vocational educators will have measurably failed.

The specific purpose of this paper is to suggest what might be useful strategies for the implementation of Exemplary Programs and Projects. It should quickly be added that the writer is not a professional vocational educator. He is a professional educator and one who is especially concerned with strategies and tactics which may be functional in program implantation. In a sense, this paper is a micro-model of its own thesis.

The writer must establish his own credibility and the relevance of what he has to say. He must be persuasive in arguing that the strategies suggested are, in fact, useful and practical for a real-world application.

And so it is for the vocational educators and others concerned with vocational education who will read and discuss this paper. They too will have to give careful consideration to the givens and the variables which will impact upon their success or failure in carrying out the purpose of the Amendments.

Inherent in a strategy for program implementation is the problem of communication. And when one considers communication he often thinks first of the source. The initial source is, of course, the United States Office of Education which will administer the Act as amended. And there are sources at the state and local levels. Vocational educators in teacher training institutions are also sources. There is no assurance that these sources will agree -- even among themselves -- upon what are Exemplary Programs and Projects. This is one of the reasons why considerable care is taken to define and set guidelines when legislation is enacted and funded. In a sense, the definitions and guidelines say to state and local vocational educators "these are the conditions which must exist if you are to participate in the use of the money." If state and local educators wish to participate in the use of these monies, they must demonstrate that conditions exist which qualify them for access to participation.

And it is precisely at this point that state and local vocational education units may hit their first snag. One of the salient characteristics of vocational education since the inception of federal assistance has been the development of a tightly knit bureaucracy -- a bureaucracy which has been profoundly successful in the development and implementation of programs of vocational education. However, one of the dominant characteristics of a bureaucratic structure is its nearly fanatical resistance to change. One of the specific purposes of organizing a bureaucratic structure is to routinize administration. An immediate byproduct of this is the ritualization of procedures, the stratification of statuses, and the diminishing of discretion extended to individuals within the bureaucracy.

Of course, this is not all bad. While the bureaucratic structure does tend to become quite impersonal, it, at the same time, strives toward being equitable in the administration of its affairs. Much of this administration is done by written policy, rule, and regulation -- and, while this does constrain educators within the organization from freely using their professional judgment, it does tend to keep the organization pointed toward the specific purposes for which it exists.

The problem with source personnel should be apparent. No program or project, exemplary or otherwise, stands to have much chance for acceptance or success unless there is a persuasive assurance that present personnel will not lose status. Statuses are both obvious and subtle. They are obvious in the formal network of organizations (i.e., titles and number of subordinate personnel) and they are subtle in the informal

relationships among personnel (i.e., a staff specialist may have the ear of the director and may, in fact, very much predicate what the director decides to do). From this might be derived a first element of necessary strategy -- EXEMPLARY PROGRAMS AND PROJECTS MUST NOT THREATEN THE ESTABLISHED STATUSES OF PERSONNEL WHO WILL ADMINISTER THEM.

This strategy element is not at all as simple as it may sound. In the first place there will be many people involved with the implementation and administration of Exemplary Programs and Projects. Not only will these people have different statuses within their own organizations but they will represent different groups and they will be geographically separated from one another. The specific triad one thinks of most often in vocational education includes vocational educators in teacher training institutions, state supervisors, and local vocational teachers. Compounding this are the six or more relatively specific areas within which vocational programs are offered. Simply put, within the organizations administering the vocational education program, status moves toward where the money is. What are the implications of this? They are difficult to predict with exactness. However, some general statements might clarify the problem. It is entirely possible that Exemplary Programs and Projects will be effected -- that they will be operational in the field -- before the vocational educators in teacher training institutions are able to institute necessary changes in their curricula which might insure that new teachers entering the field will be able to service these programs and projects. It is also possible that teacher trainers and state supervisors will not be able to augment their programs rapidly enough to provide needed in-service experiences for field personnel who are managing the programs in the schools and communities. In itself, this is potentially threatening and may lead to some foot-dragging among critical personnel -- personnel who must <u>support</u> the programs and projects if they are to be implemented at all.

A subordinate tactic which might be considered at this point involves soliciting the involvement and support of vocational educators who are relatively new in the field -- or, for that matter, personnel who are relatively new in teacher training institutions and state departments of education. The reasoning here is simply that these people who are new to their positions and new in the bureaucracy will be striving for status and they may see that through Exemplary Programs and Projects there is a unique opportunity to open up the system -- an opportunity for them to ascend more rapidly than they might have through the traditional structure of the organization. But, even with this tactic, a caution must be offered. The use of new personnel who are aspiring to higher status must be accompanied by at least the tacit approval and support of high status personnel in the formal structure of the organization.

In a way, the endorsement of present leaders in state education departments, teacher training institutions, and among the field practitioners is a test of the real status these men enjoy. Their endorsement and forceful support of Exemplary Programs and Projects suggest

that they feel secure enough not to be especially threatened by a new order of things.

Nevertheless, it remains that the funding of any Exemplary Programs and Projects means that other activities will not be receiving equivalent support. And, in turn, this means program and project directors must accept that there will be some of their professional colleagues who will not be particularly happy.

The initial focus of these comments has been upon the professional personnel who will identify and implement the Exemplary Programs and Projects. The initial focus was no accident. While Rogers[1] states that "It is the characteristic of a new product not as seen by experts but as perceived by the potential adopters that really matters," it remains that the complex organizational structure which exists to deliver vocational education systems must also desire change before any significant change can be implemented.

Once one has considered the source of communication, he then must become concerned with the message to be transmitted. Again, the purpose stated in the 1968 Amendments makes it abundantly clear what the message is -- "... (to) create a bridge between school and earning a living ..." But this is a broad statement -- and, wisely so since it gives vocational educators a great deal of latitude in devising or selecting programs and projects which are truly exemplary. But it remains for professional vocational educators to designate which programs and which projects are exemplary. While the language of the Amendments specifically states "new ways," one might suggest that there may already exist activities which are exemplary. In fact, one approach to maximizing change might be to capitalize upon some of the very fine program elements which already exist rather than frantically jumping from one change to the next using the premise that change per se is good.[2]

Zander[3] cites the urgency for the message to have clarity when he discusses conditions which are conducive to resistance to change. He states, "Resistance can be expected if the nature of the change is not made clear to the people who are going to be influenced by the change.... Many people fear incomplete information about changes which influence them." One might speculate on how the message pertaining to the 1968 Amendments could be incomplete or confusing -- creating "mixed messages." For instance, are Exemplary Programs and Projects going to require that there be constructed and used a carefully developed linkage system among the many individuals and agencies interested in what is done? Or, will it be possible for the entrepreneur to strive for an exemplary program -- will it be possible for individuals and small groups to work from a base of dedication and commitment when there is no "hard" evidence to suggest that they have a chance to succeed? Or will it be that any program which endeavors to treat the population specified in the Amendments shall be supported?

It also can be asked whether there must be some formal plan for evaluating the consequences of the program or project so that there may be some relatively hard data generated -- data which may serve to improve the liklehood that further funds will be available to increase the possibility that the endeavor is firmly implanted. All these questions are intimately involved with the message that goes out to both the administering personnel -- professional vocational educators -- and to the people who will be the recipients of the programs and projects. As always, there is the risk of over-simplification and over-generalization. The 1968 Amendments can be interpreted in a manner which so constrains application that impact will hardly go beyond "salting" existing programs or, they may be interpreted so broadly that whatever programs and projects are funded will defy administration and may fall prey to the opportunist who in the modern vernacular wants to "do his thing" but, who often has no desire to assume a responsibility for the efficacy of the program or to work toward the integration of the activity within the broadly based educational program of the school-community.

A second element of strategy may evolve from this consideration -- ACCEPTANCE OF EXEMPLARY PROGRAMS AND PROJECTS WILL DEPEND UPON THE EXTENT TO WHICH THEY ARE DESCRIBED IN A STRAIGHT-FORWARD MANNER AND UNDERSTOOD BY BOTH THOSE WHO WILL ADMINISTER THEM AND THOSE WHO WILL BE THE RECIPIENTS. While the analogy is imperfect, it is useful to remember that the United States Department of Commerce has estimated that some ninety per cent of all the new products put on the market fail to succeed within four years of their release.[4] Here is the risk that we may become infatuated with our prolific cultural adaptability -- the risk that we may lose sight of the magnitude of our failures; not because all that failed was really desirable and should have been adopted but because we still lack the technical and procedural know-how to assure that a program of change can be implemented and that it can make a difference over a period of time.

It would seem that the 1968 Amendments are extremely clear on this point -- the intent is that Exemplary Programs and Projects be funded so that they do not fail; so that they will generate maximum change over time in the educational process. However clear and understandable the message may be, it is of little consequence unless appropriate channels of communication are selected for the transmission of the message. Assume for the moment that those who will administer the programs and projects are convinced that they have merit -- how then are the community and the direct recipients persuaded to support and participate? "Ultimately, youth will decide what is relevant and what is not."[5] However, Exemplary Programs and Projects must consider both the short and the long haul. It is not enough to "promise" youth that staying with it will increase their life earnings potential by X dollars. The message and the channel by which it is communicated are essential because if they do not touch youth now, they will not participate in the programs and projects -- they will not be recipients and whatever the future might have held will in reality have no meaning for them.

Might it not be assumed that we have not done a particularly effective job of reaching youth today? Possibly it has been the message; possibly the programs and projects which presently exist are not seen by youth as being particularly relevant to them as they see their lives; and possible we have made an error in strategy when we have resorted to relatively traditional means of communicating with youth. Is it not possible that we must create new channels of communication if we are effectively to reach youth? "What is worthy of belief and who is worthy of belief are key influences in the individual's acceptance or rejection of an idea."[6] A specific case may make the point more didactic. "Water Boiling In A Peruvian Town"[7] was a study of an innovation which failed. Nelida, a change agent, was sent to Los Molinas to instruct the natives in certain health measures. Her specific effort was directed toward getting the natives to boil water so as to sterilize it with the hope that this practice might reduce the high incidence of illness being caused by polluted water. After weeks of effort only five per cent of the families had adopted the practice of boiling water. Some of the factors associated with Nelida's failure were:

1) Most of the peasants associated Nelida with the middle class. The few who adopted the practice were higher status in this community.

2) Those who adopted the practice were not the influentials or opinion leaders.

3) Water boiling as a health measure was not a part of the experience of the villagers. Because the boiling of water in this village was associated only with the sick, those who were not ill at the moment did not perceive a need to boil their water.

4) The change agent was not accepted into the culture of the village. She was considered an outsider.

What does this say about implementing Exemplary Programs and Projects? From this failure to invoke change several strategies are suggested:

EXEMPLARY PROGRAMS AND PROJECTS MUST BE ACCOMMODATED TO THE CUSTOMS OF THE INTENDED RECIPIENTS -- AT LEAST INITIALLY AND UNTIL OTHER VALUES AND ATTITUDES CAN BE GENERATED.

EXEMPLARY PROGRAMS AND PROJECTS MUST BE POINTED TOWARD REACHING AND IMPACTING UPON "INFLUENTIALS" AMONG THE RECIPIENTS.

EXEMPLARY PROGRAMS AND PROJECTS MUST EMPLOY CONTACT PERSONNEL WHO HAVE CREDIBILITY WITH THE INTENDED RECIPIENTS.

Each of these strategies suggests some specific tactics. For instance, where the intended recipients of programs and projects are youth who have already demonstrated that the school environment has alienated them, using a school-based person as the contact with youth may be a tactical error -- it may breed even more hostility and doom a well conceived program before it gets off the ground. Where the school per se

and professional educational personnel enjoy little or no credibility with youth it may be desirable -- even essential -- that Exemplary Programs and Projects be mounted through contact persons who we may call, for lack of more accurately descriptive language, paraprofessionals. When the intended recipients of Exemplary Programs and Projects are indifferent and dissident youth it is even more imperative that vocational educators sense the urgency for entering into whatever may be the "life style" of the participants to be served. Probably nothing can be more deadly than attempting to initiate change from the position that one is going to save youth from the iniquitous future they face. Tactically, this approach punishes youth for what they are and what they have become -- and, at least in part, we are responsible for what they have become. Rather than a "do-gooder" approach, might not it be wiser to accept what youth are and to capitalize upon what are their present interests and aspirations?

Admittedly, we are being judgmental. When the 1968 Amendments speak of bridging between the school and earning a living for young people, they are saying that earning a living is "good" and that it is desirable -- as we see it. But to implement Exemplary Programs and Projects (and, especially for the youth designated) it must be remembered that there are many youth who have had extensive experience with ADC, with "hustling" as an alternative to earning a living, and with both prolonged and incipient indigency. If Exemplary Programs and Projects hope to impact upon these populations they must do more than offer promise and hope. They must offer a viable alternative for the immediate moment.

Tactically, what is being suggested is that Exemplary Programs and Projects must enter the marketplace and vigorougly vie for the lives of these youth. It could be argued at this point that too little attention has been given to the youth who want -- who seek -- avenues by which they can become gainfully employed. The counter argument is that youth who seek this will find it -- either through existing programs of vocational education or outside this sphere. Those who are strongly motivated will find a way --and, it should be remembered that present vocational programs are right now serving no small number of youth who are so motivated. Many of these youth are enduring no small hardship to continue with their education. The problem is less with those have chosen to continue their education than it is with those who have abandoned it.

If the primary concern of the 1968 Amendments is to reach youth -- especially the "hard-to-reach and the hard-to-teach" -- then careful consideration must be given to the channels of communication which are used by these people. For example, there is some evidence to suggest that students presently engaged in pre-service vocational programs have themselves been effective channels of communication. Where the vocational program has been conducted in conjunction with local industry which is a potential employing source -- often, conducted as a "partnership" between the school and the industrial complex -- the student who is in school has demonstrated that he can be an important communications link with older brothers and sisters, other members of his peer group and even with his parents and other adults in the community who may be out-of-work or who

may be very much aware that their present vocational skills are less and less marketable.

Again, this message has relevance only for those who want to work. But, for these people the message is clear. The kinds of tasks being performed by salaried and hourly employees are being taught through the vocational program. Teaching specific skills also presents a paradoxical problem for the vocational educator -- and, ultimately, for potential employers or the individual if he becomes self-employed. The paradox lies with the understanding that teaching for specific skills quickly loses efficiency in our complex world of work when re-vocationalization is one of the anticipated consequences of one's being a member of the work force for any period of time.

Facing this problem, vocational educators in conjunction with professional counselors have striven toward developing in students desirable attitudes about work -- attitudes which will make them less resistant to changing tasks as old skills become obsolescent and new skills are required to perform new tasks. But, here is the paradox. Youth must somehow develop some skills for existing tasks if they are to gain their first employment. While industry may be more than willing to teach the specific skills necessary to perform their tasks, hard-to-teach and hard-to-reach youth may not find training for "attitude development" very acceptable to them. And why not? Some of the very reasons why they are hard-to-reach and hard-to-teach result from the values and attitudes which they presently hold.

Corollaries for some of the strategies suggested might be:

EXEMPLARY PROGRAMS AND PROJECTS MUST DEVELOP PRESENT AND POTENTIALLY SALEABLE SKILLS BEFORE UNDERTAKING REMOLDING THE ATTITUDES OF THE RECIPIENTS.

EXEMPLARY PROGRAMS AND PROJECTS MAY REACH MORE "INFLUENTIALS" AMONG THE INTENDED RECIPIENTS WHERE THERE ARE HIGHLY DIVERSIFIED ACTIVITIES AND WHERE AN ATTEMPT IS MADE TO SATURATE THE POPULATION.

RECENTLY EMPLOYED AND PRESENT PRE-SERVICE VOCATIONAL STUDENTS MAY HAVE MORE CREDIBILITY -- AT LEAST INITIALLY -- WITH THE "HARD-TO-REACH AND HARD-TO-TEACH" THAN MIGHT VOCATIONAL EDUCATORS, PROFESSIONAL COUNSELORS, PERSONNEL MEN FROM INDUSTRY, OR THE EMPLOYED INDIVIDUAL WHO HAS "MADE IT BIG" IN THE WORLD OF WORK.

The very fact that Exemplary Programs and Projects propose to "take students and others where they are and as they are" will generate another problem when it comes to maximizing change in the educational process. It must be conceded that there is already some hostility between the so-called academic areas of the school and the vocational training programs. Part of this may be the result of vocational programs demonstrating more immediate and direct relevance for the student as he views his post-school life. The school too is a complex organization and, as such, it is highly bureaucratized. When some relatively

traditional elements of the educational program still require that students perform particular rituals and acquire some specific substantive knowledge, these same elements may become increasingly resistant to programs which permit more freedom for divergence from the usual format. The problem for implementing Exemplary Programs and Projects is especially critical since the invocation of "maximum change in the educational process" necessitates the full support of all personnel in the educational establishment.

One strategy which might be useful in the development of Exemplary Programs and Projects would be to design activities in such a manner that they served more than the youth who are touched by the traditional vocational education program. While unfortunate -- if not tragic -- many K--12 teachers may still look upon vocational education programs as preparatory for what has been thought of as "blue-collar" types of positions. And while this is obviously not true, there is the continuing myth that the only reason a "college-bound" student would take courses in vocational programs would be for the development of skills which he might later employ in his avocational interests. The fact would seem to remain that too many people -- among them many professional educators -- respond to vocational programs in schools as if they were an alternative to the "regular" educational program. Specifically, then, a strategy might be the following.

EXEMPLARY PROGRAMS AND PROJECTS MUST BE PRESENTED AS COMPLEMENTARY, NOT SUPPLEMENTARY, TO THE OTHER ELEMENTS OF THE EDUCATIONAL PROGRAM OF THE SCHOOL.

Again, there are parallel populations for whom this strategy will have to be persuasive; both the professional educational personnel within school systems, teacher training institutions, and state educational departments and the potential recipients of the programs and projects. Either population segment alone is not enough -- changing the educational process requires that both the "doers" and the "receivers" be persuaded that vocationally oriented program elements are, in fact, integral elements in the educational program.

Concern with program and project administrators and recipients is a further stage in the communication process which is so essential to the dissemination and implantation of a desired change. These people are the receivers of the messages sent by sources through the channels which have been selected for maximum impact. There remains in the communication process one other concern. Ultimately, this concern is the heartstone of programs and projects to maximize change in the educational process. The concern is effect. Effect really speaks to the difference between implementation and implantation. With Exemplary Programs and Projects there are a variety of ways by which activities can be started or implemented. But, what of the strategies which will assure that these activities persist through time? Seed monies may get them off the ground but it remains for activities to demonstrate sufficient merit that they will be sustained over a period of time -- and, not just sustained as separate entities rather that they become integral elements of the total educational program.

Effect can be viewed in a broad perspective (i.e., do the Exemplary Programs and Projects significantly reduce the numbers of unemployed or unemployable in a specific geographic region?). And it cannot be gainsaid that this broad view will be important if vocational educators hope to persuade legislators to continue to fund programs and projects. However, there are also other perspectives -- often, perspectives which are much more subtle and which frequently defy careful assessment and quantification. While gross statistical data give something of a national and state picture, in the final analysis Exemplary Programs and Projects will have to "make it" with real, individual people.

Strategy recommendations to this point have attempted to persuade that programs and projects must be acceptable to both those who will administer them and to those who are the intended recipients. And inherent in this may be a problem. Is it not possible that some of the more successful Exemplary Programs and Projects may come to owe their success to the recipients finding the activities especially functional for them as they see their lives? And is it not also possible that these same programs and projects may be unpopular with -- even repugnant to -- legislators because of conflicts between their values and attitudes and those of youth groups which we have already labeled as "hard-to-reach and hard-to-teach?"

In essence, how are we to answer the question of which group is to be served when there are differences of opinion on the worth of programs and projects? A strategy which might at least get at the problem could be the following.

EXEMPLARY PROGRAMS AND PROJECTS SHOULD HAVE AT LEAST A TWO-FOLD GENESIS -- SOME SHOULD BE PURPOSIVE AND THE RESULT OF PROFESSIONAL JUDGMENT AS TO WHAT IS NEEDED AND OTHERS SHOULD BE MORE OF THE "RISK" VARIETY WHERE THE INTENDED RECIPIENTS ARE THE MAJOR ARCHITECTS.

If this strategy is followed, there is the real danger that there will be hidden agenda -- agenda which say, in fact, that evaluation procedures will"demonstrate" that professionally conceived programs and projects have been those which really "worked." Implicit in the strategy of taking some risks with the recipients -- the "hard-to-reach and the hard-to-teach" -- is the notion that they too may have some excellent notions as to how they might move toward making their lives more meaningful. And, it can be argued, if the recipients of Exemplary Programs and Projects do not find their lives to have meaning, no activity professionally conceived or otherwise is going to really carry the day.

If the risk is taken it becomes essential that <u>all</u> parties to Exemplary Programs and Projects -- including potential employers -- actively support these programs as much as they do those which have been professionally conceived and implemented. Unless we wish to take the position that we, as professional educators, have some special omniscience for maximizing change in education (and, our present won-lost record hardly supports such a position) there would seem to be

some room for our carefully observing some "other ways" of getting the job done. And possibly it will be discovered that some of the present vocational programs and projects which we have underestimated in terms of their impact upon the educational program are the very activities which are having the greatest impact upon youth. The point is, do we really know? Until we have some sure knowledge of what are Exemplary Programs and Projects, exemplary in the sense that they are effectively reaching the intended recipients, it would seem that a good tactic might be to keep an open mind.

The question of taking risks and ascertaining effect has yet another dimension which involves strategy. Particularly with high-risk programs and projects (but, certainly not limited to these) there is often a pressing desire -- if not need -- to demonstrate results which tend to agree with the general objectives which were outlined for the activities. The problem is one of latency and measurability. Many of the effects of Exemplary Programs and Projects may be latent -- they may just not appear at the surface and be observable as changes in behavior either among the recipients or within the educational process itself. An example of this is the student who seems to demonstrate no increase in skill activity or remains at about the same level of achievement. He appears to have reached his "limit" or be on a "plateau." Then, often very much to the surprise of the individual himself, at a later point in time it is demonstrated that skill gains have been made and that achievement goes up. Problems of latency are inextricably tied with measurement. Our available tools of measuring "what happens" to youth in an educational process are just not refined to the point where we can immediately tease-out with any great precisions what has happened or what is happening.

Strategically, then:

EXEMPLARY PROGRAMS AND PROJECTS MUST NOT BE PERMITTED TO RISE OR FALL AS A RESULT OF IMPETUOUS DESIRES TO DEMONSTRATE THAT THE INTENDED CHANGES DID, IN FACT, OCCUR.

And, there is a corollary for this strategy:

EXEMPLARY PROGRAMS AND PROJECTS WHICH DEMONSTRATE IMMEDIATE GAINS SHOULD NOT NECESSARILY BE ASSUMED TO HAVE THE CAPABILITY OF DELIVERING INTERMEDIATE OR LONG-TERM GAINS.

This should in no way be construed as an argument for not bothering to assess or evaluate the Exemplary Programs and Projects. The fact that our tools of inquiry are imperfect makes it all the more imperative that an especially diligent effort be made to assess with care. But it must be remembered that these tools are imperfect and that timing is also a variable -- no visible evidence of gains at the moment does not necessarily mean that no gains have accrued.

The 1968 Amendments propose national programs -- but, when conceived, they will probably vary greatly depending upon which region or state is directly administering the program or project. It seems

logical to assume that professional personnel will assess their capability to deliver the particular support systems necessary to invoke Exemplary Programs and Projects. And it is likewise reasonable to expect that local or area data will be used to predicate the nature of the programs and projects. Such variables as the incidence of unemployment, the relative holding power of the schools, the types of employment opportunities which presently exist and which are projected for the immediate future, and an assessment of what are believed to be the necessary characteristics of activities which will provide a linkage between the school and earning a living for youth.

What may be overlooked is the pattern of mobility of particular population segments in the United States. The over-simplified statement is that we have become a highly mobile people, etc. We have and we have not -- it depends very much upon which population segments one is talking about. Obviously, having unemployed persons move from one geographic area to another without yet finding or being capable of gaining employment does little more than shuffle the problem around the nation. And what of the socially alienated youth who choose not to move to an area where they might be able to find employment? What of the potentially employable individual who is unwilling to move to a new area where there may be a critical shortage of personnel possessing the skills he already has? If Exemplary Programs and Projects are to have any real hope for impacting upon the social scene through the invocation of maximum change in the educational process, they must attack the problems at the national and local level simultaneously.

The individual's aspirations and society's expectation that one will somehow become gainfully employed can be made a value taught for by the school only if the school is willing to accept that there are only a short few years during which a major portion of the youth population must be in attendance. If the strategy decided upon is one of waiting until youth are "old enough" to fully comprehend what this value means in our society, the educational process will have failed. It will have failed because the very youth we describe as "hard-to-reach and hard-to-teach" are no longer in school at that point. And the few who may still be in attendance may be so alienated that presenting them with a societal value which runs quite contrary to their own may only serve to increase their alienation.

If Exemplary Programs and Projects in vocational education are to impact upon a broad front, it seems clear that persuasive and meaningful activities will have to be implemented in the early years of schooling -- even the middle, intermediate or junior high school may be too late. It might even be suggested that one of the reasons we have "hard-to-reach and hard-to-teach" youth is because society -- parents, educators, and others -- failed to reach youth effectively and soon enough. Or, could it be that we did reach them and that the message they heard from us assisted in creating the problem? While with older youth it may be necessary to develop some specific work skills before the problem of attitudes toward work can be attacked, with elementary school age youth the possibility exists that attitudes can be attacked first and that

there should be some reasonable hope for success with such a program. Strategically this suggests that:

EXEMPLARY PROGRAMS AND PROJECTS MAY BE ABLE TO EFFECTIVELY IMPACT UPON ATTITUDE DEVELOPMENT IN YOUTH IF THESE ACTIVITIES ARE UNDERTAKEN EARLY ENOUGH IN THE EDUCATIONAL PROGRAM AND ESPECIALLY IF VIGOROUS EFFORTS ARE MOUNTED IN ELEMENTARY SCHOOL PROGRAMS.

Such a strategy also means that a major effort will have to be made to train and make available professional counselor personnel who are specifically prepared to work with youth in the elementary school. Such training programs do exist today but there is a paucity of personnel available to take positions in the field. Possibly some of the Exemplary Programs and Projects in vocational education will represent efforts to creatively link counselor training institutions with vocationally oriented programs in elementary schools. If vocational education is a basic objective of all education and fundamental to each individual's education, such exemplary activities would seem to be very much in order.

One of the reasons for mounting a nation-wide program for improving the impact of vocational education upon the whole educational process is that the problem itself is nation-wide. At the same time, the problem demonstrates similarities and differences -- while many rural and ghetto dwellers may be out of work and may not be employable because of the skills they do or do not possess or because of where they reside, delivering vocational education systems to these people presents quite different problems. If any one thing <u>is</u> clear, it is that our <u>present</u> vocational programs and projects are not proving to be sufficient to meet today's demands -- both the demands of people needing to be employed and the demands of potential employers.

This does not mean, however, that all Exemplary Programs and Projects should necessarily represent activities which have not been tried before. It may mean that if we wish to have a maximum impact upon change in the educational process some of the presently conceived programs and projects -- particularly those which have demonstrated some measure of success (or, promise for it) -- should be more liberally funded. Of course, if this tactic is used, vocational educators will make themselves vulnerable to criticism on the grounds that all they are really doing is "spending more money on the same old programs." But sight should not be lost of the fact that spending more money --or, as some of us might prefer to put it, making a larger investment -- is in itself a change. It is entirely possible that numerous excellent programs and projects are already in operation and that they have failed to have a marked visible impact upon the educational process for the simple reason that they have not yet been adequately funded.

Hence, the following strategy is suggested:

EXEMPLARY PROGRAMS AND PROJECTS MUST IDENTIFY AMONG EXISTING VOCATIONAL EDUCATION ACTIVITIES THOSE WHICH HAVE ALREADY SHOWN A MEASURE OF SUCCESS -- CAPITALIZING UPON THIS MIGHT MEAN AN UP-GRADING OF FUNDING FOR SPECIFIC

ACTIVITIES AND THE BORROWING OF PARTICULARLY SUCCESSFUL ELEMENTS SO THAT THEY MIGHT BE INCORPORATED INTO NEW PROGRAMS AND PROJECTS.

As with most strategies, there are some cautions to be observed. An obvious problem already suggested in conjunction with other strategies involves the matter of funding or, to be more crass, money. While we know that it is necessary to have differential expenditures to reap equivalent outputs -- especially where the treatment groups distinguish themselves by their heterogeneity -- we also are very much aware that emphasis, thrust, prestige, and status tend to gravitate to those programs and projects where the larger amounts of money are being invested. The heart of the problem lies with the fact that people in general somehow expect that there will be dramatic gains where there has been a massive infusion of resources. It is difficult to persuade that one of the reasons for the massive infusion of resources is that the problem being attacked is especially vexing and that as a result of this nominal gains in the comparative sense may be a more signal achievement than one assesses at first glance.

Conversely, and compounding the immediately preceding problem, some Exemplary Programs and Projects may require a comparatively smaller investment (possibly because of the nature of the problem -- i.e., the lack of complexity or the homogeneity of treatment group) and yet may give visible evidence of impacting dynamically upon the educational process. What is the consequence of this paradox in the perception of program and project outputs? One possible consequence is that resources will be diverted to relatively simple problems which can be solved in a manner promising to yield highly visible, positive outputs -- specifically, the types of gains enumerated as "desirable" in the purpose of the 1968 Amendments. This could also be seen as a strategy of "running scared" when one discovers that the really difficult problems do not have simple solutions and tend to produce low yields.

It might be remembered that Congress enacted the 1968 Amendments because the general problem is complex and vexing. It might even be well for us to focus for a moment upon what is the intent of "... maximum change in the educational process." While this may refer to the magnitude of change, it might also allow for a nominal change if that nominal change has great significance. An analogy, while it is imperfect, might serve to make the point clearer. Educators often dote upon measuring or assessing those activities in the educational process which lend themselves to easy quantification -- they are manipulable. But those things which lend themselves to easy measurement may not be the crucial elements of the program. Measurement of some outcomes of the educational program is extremely imprecise -- but, these same outcomes which are difficult to quantify may be among the most important outcomes of the educational process. Simply put, nominal gains in some programs and projects may be extremely significant and estimates of change which appear to be crude and nebulous may have much greater import than highly precise data on less pivotal activities.

The following strategy is, among other things, a test of how secure vocational educators really feel in attacking the specific problems outlined in the 1968 Amendments.

EXEMPLARY PROGRAMS AND PROJECTS MUST BE QUICK TO IDENTIFY DIRECTIONAL CHANGES IN THE EDUCATIONAL PROCESS -- ESPECIALLY WHERE THESE DIRECTIONAL CHANGES SIGNIFY GREATER GAINS THAN DO HIGHLY VISIBLE ACCOMPLISHMENTS WHICH HAVE A LESSER ORDER OF IMPORTANCE.

The persuasion of the foregoing strategies and comments remains to be tested as Exemplary Programs and Projects are identified and implemented. However, there will never be a test unless enough confidence is placed in the strategies to deem them worthy of trial. Many of the strategies are really statements of common sense and, as such, many of them are now in use -- many have already demonstrated their worth to vocational educators. Acknowledging that Exemplary Programs and Projects will be both already established and newly conceived activities, it seems essential that careful attention be given to the critical problem of communication. It cannot be assumed, for instance, because a program or project already exists that it is fully or accurately understood. It is possible that a newly conceived activity may come to be more readily understood and implemented than a counterpart established activity.

It is imperative that Exemplary Programs and Projects gain credibility with intended recipients. However, before concern with recipients can be dealt with, concern must first be given to recruiting the support of those who will administer the activities. Rogers and Jain[8] argue this concern when they state "...relatively little emphasis has been placed upon diffusion within organizational structures." Some of the specific questions which arise include; how shall Exemplary Programs and Projects be identified or conceived -- from within the group of professional vocational educators, from without of this group, from the state level, from individual schools, or from many or all of these sources? If it is not clear from whence programs and projects may emanate, petty bickering and unnecessary competitiveness may replace a unified striving for success. The problem is already enough complex and vexing that we do not need to add to it by creating divisiveness among ourselves.

The educational process will change -- it is changing. Whether vocational educators through Exemplary Programs and Projects will influence the direction of this change will very much depend upon how willing they are to invoke strategies which offer the promise of success. Vocational educators can influence change. The evidence is clear -- the basic data on diffusion and the adoption of new, improved programs have been generated by vocational educators. It would be tragic indeed if the very group which has seen so much success in influencing change were to be the one which failed when challenged with the implementation of Exemplary Programs and Projects.

BASIC ELEMENTS AND CONSIDERATIONS IN
PLANNING AND DEVELOPING EXEMPLARY PROGRAMS

By *V. E. Burgener*, Director of Research Coordinating Unit
Board of Vocational Education and Rehabilitation
Vocational and Technical Education Division
Springfield, Illinois

Introduction

This paper is the last in a series of ten which have explored implications, philosophy, priorities, models, resource materials, guidelines, administrative patterns and human relations impinging upon exemplary programs. I hope to outline for you, based primarily on past experience, *how a system can operate.* I have no review of literature to determine what research has been done in getting an idea, refining it, and bringing it to the culmination of a proposal which could be presented for possible approval and funding. Therefore, I have no bibliography. I did not consult Webster to distinguish between exemplary or innovative programs and, consequently, you will have to rely on definitions established in the early parts of this conference. I have not read what is probably the best approach to developmental processes because I have been trying since December to get a copy of The Enterprising Man, by Collins and have not yet been able to find it.

Instead, I reviewed with my colleagues the procedures we use to move exemplary and experimental programs from *idea* to *implementation.* Therefore, almost all of what I have to say to you is based entirely on our experience in Illinois with more than 50 separate projects that we arbitrarily, and perhaps incorrectly, have called experimentation. For the most part, they have been exemplary in nature although some of the failures have proven that not all were necessarily usable nor could all eventually be implemented. My suggested system follows a continuum of progress from the establishment of an idea through the development of a proposal, approval action, and further activity that leads to regularization or final disposition. One of the consultants in our Illinois Research Coordinating Unit puts it in the context of "What Happens To An Idea." This may be of value to you and is available as a separate paper. We call the procedure that I shall attempt to outline for you today, "vocational *imagineering.*" It is the method by which an idea can be transformed into reality. The *imagineer* is an imaginative designer of educational processes.

Body

We must first start with an idea. What the mind of man can conceive, the intelligence of man is able to produce. I believe an idea should not have to wait until it fits into a schema of prearranged priorities. For a considerable length of time there has been a conflict in relation to the importance of priorities for educational ideas.

The problem may be greater in research, because presumably many exemplary ideas will already have been tried, evaluated and recommended. Such exemplary ideas will already have had a sufficient demonstrated value to establish their own priority. You have had presented to you during the last two days a number of models, all of which have certain merits, and which can be utilized, adapted, or adjusted into an exemplary program in some other situation than the one in which it originated. Priorities can serve as controls but also can prevent dissipation of funds. Dissipation can occur by doing those things which are already operational or which could be done to a sufficient degree by regular conventional methods. These should not be classified as exemplary.

Ideas which are outside any priority area can be so irregular, unmanageable, or unusable that the return from them is very speculative and perhaps so nearly subject to failure that approval by any governmental agency is not likely. Neither State nor Federal agencies are notable "risk takers." A system of priorities will often welcome an Edsel but refuse Xerography.

In 1965, we tried to establish a system of priorities for the greatest needs of vocational education in Illinois. Dr. Venn will remember his participation with us in that effort. We first considered the types of priorities which Dr. Venn outlined in his book Man, Education and Work. Our effort then was to determine those areas of greatest concern in our "Planning for Measured Change."

There was almost unanimous agreement

- that vocational education had not been relevant to many of the populations it was expected to serve;
- that we had not provided sufficient programs to meet the needs of the disadvantaged;
- that skill training had been too restrictive;
- that teachers should be more cognizant of individual needs of students;
- that vocational education needed a new image;
- that it must enroll greater numbers of students;
- that curricular changes were long overdue;
- that teaching methods were outdated; and
- that equipment was obsolescent.

We then established general parameters within which we would solicit "experimental projects" that would cause *measured change* in vocational education. As long as those changes were applicable at the local level, everything was satisfactory.

When suggestions were made that teacher education needed a complete overhaul because teachers were not being properly prepared to provide placement service; guidance and counseling assistance at the elementary level; new curricula; or many other activities that were admittedly needed, the teacher educators rather forcefully resisted such changes. They pointed out that it would be possible to achieve better teacher education if enrollees just had time to take all the "goodies" their college catalogues now offered. Their solution was additional time and additional enrollment in additional work. When we proceeded to the third portion of the triangle and attempted to suggest projects that would lead to a changed administrative structure for vocational education at the state level, we were really in trouble. Most of the leaders of vocational education thought we were becoming like the minister who had exhorted against sin in a very fine and long sermon. Eventually, he castigated those who were back-biting, gossiping, and carrying false tales about their neighbors. At the end of the service, one little old lady said, "Preacher, when you fight against sin, that's real *preachin'*, but when you start talking about our personal lives, that's *meddlin'*." And so it was with projects that proposed changes in administrative structure or with projects that would suggest replacing an outmoded structure of teacher education.

Most projects which have been funded since the inception of the Research Coordinating Unit in Illinois, have been developed from an idea by a local person to improve local programs. They are characterized by their diversity and futuristic objectives. In this spectrum of projects there is a land laboratory for students with special needs and a university microteaching project. As the spectrum broadens, other ambitious innovations are exposed - courses which lead into the growing aerospace industry; new approaches toward a more generalized cooperative vocational education; visual communications as an occupational opportunity; vocational guidance by television; and field testing a high school concrete curriculum. Controlled occupational-experience laboratories have been successful as have motivational activities for potential dropouts, the disadvantaged, the handicapped, and slow learners. Other examples are projects in data processing, health aides, ornamental horticulture, child care, and food service.

This variety of exemplary and innovative projects was fragmented, and did not contribute to any one priority area of vocational education. As a result, even though not intentionally, such projects now provide a very good base of experimentation which can lead to replication, duplication, and modification for numerous exemplary programs in Illinois as well as other states. The Appendix (A) lists all of the different kinds of projects which we have conducted as experimental and demonstration projects since 1964. Most of these projects have

been one to three years in length but a few have continued for as long as four years before regularization or termination.

Not all have been successful, of course, and this is perhaps our greatest argument for calling them experimental. Some of them have been unsuccessful but most of the "unsuccessful" ones are those that have proposed *meddlin'* with some administrative or teacher education structure at the state level.

The most exceptional ones are those which have adjusted or changed a situation within a local school. This leads me to believe we should concentrate on local change as we attempt to develop a nationwide system of exemplary programs. Another principle is involved, however, which we learned from experience. Some sort of an operational structure must be established at the state level specifically to administer and operate such programs. The nationwide effort to operate programs for the disadvantaged through the traditional organizational structure of subject matter areas has been very unsuccessful even under the mandate of PL 88-210. For example, a representative of the U. S. Office of Education recently told members of our state staff that it would be no particular problem to increase the reported number of *Persons With Special Needs* because there must be some who could be so categorized within the regular operational structure of every vocational education class now being conducted. However, the only spots where we and many other states have shown any real growth in programs for *Persons With Special Needs* have been where special efforts, special programs, and special curricula have been developed and offered. We now have, for example, a consultant on our state staff whose responsibility is the development of programs for *Persons With Special Needs*. We have another consultant whose responsibility is the development of cooperative vocational education programs. One type which we call CWT, Cooperative Work Training, originated in the City of Chicago, was first funded through the Research Coordinating Unit as an experimental program and now has been regularized. Within a three year period it has grown to a larger number of enrollees than any other existing cooperative educational program. By next year it will likely exceed in size all of the other cooperative education programs in Illinois. This has been possible because an operational and administrative structure at the state level promotes, develops, works with and approves teachers and coordinators in that special area.

I am convinced that exemplary programs will be dissipated unless each state assigns an organizational structure to give specific leadership. It may be the RCU; it may be a planning division; it may be a part of the operational division. A separate organization charged with the responsibility for administering exemplary programs is imperative or efforts will be diverted to extend programs which are already in operation.

After finding and accepting an idea, we must locate and identify personnell to develop it. How do you recognize an educational *imagineer?* We challenge them to INNOVATE or STAGNATE. Exemplary

programs imply by their very nature the necessity for doing something new and different. Standing still becomes stagnation.

There may no greater sin than knowing what changes need to be made, but making none. Nothing is more sure than change and nothing is more disturbing than change. No one is more threatening than the change agent. No one is more necessary to the continued health and welfare of vocational education than the free wheeling, far thinking, rabble rousing, dissatisfied educational *imagineer*. He is the initiator, the irritator, the instigator, the inventor, the innovator, the improvisor, the improver, the inducer, the inciter, and the incipient trouble maker. We often think we can't get along with him, but we could hardly do without him.

The *imagineer* is often at a loss as to how we may operate because he finds that administrators of research and educational administrators especially usually prevent all but evolutionary change. A good administrator is usually not an innovator at heart and does not welcome change, for it adds to problems of control in his group or agency. He is committed to efficient product output which is maintained by an ongoing, relatively stable agency. The educational administrator tries to repair the bicycle while riding it. The educational designer is meanwhile fashioning a new wheelless vehicle to travel on a cushion of air. Then he can't sell it, (and generally doesn't really try) because educational practitioners have accumulated a 20 year supply of bicycle repairs and by now have trained everyone to ride bicycles.

We have not yet concerned ourselves in vocational education with the training of developers - middlemen - or transition experts who can bring principles or theories of change to the level of implementation. We must search for such persons to establish and conduct exemplary programs. When selecting individuals to work in this type of activity, I look for persons who are unsatisfied with the status quo, who are disillusioned with what vocational education has been able to achieve and who are action oriented. With this philosophy they are generally eager to revise procedures and use new methods.

Next, we should determine how an acceptable idea can be developed into a usable activity. Generally, the first step is to modify, adjust, discuss, and change the idea into a form that can be made into a proposal. In the process of refining, modulating, or massaging an idea it is good strategy to utilize groups of peers, other individuals in the community who may have some ideas for modification, and persons at the State and Federal level who have had experience relating to the problem at hand. At this time it is valuable to review prior educational inventions. Committee action is not usually a practical way to develop or modulate ideas. In a committee, the will of one individual may be dominant or consensus may not be obtained. A group structure that might be

quite usable in the preparation of an idea is included in Appendix (B).

Although it is generally better for an individual to develop an idea and subject it to reactions from other individuals, this is dangerous for the originator, too. I am reminded of a story reported in the Phi Delta Kappan of the researcher whose proposal was disapproved after being sent to three very skilled readers. The rejection note said, "We are sorry your project could not be funded but we are approving *three* feasibility grants to determine the validity of the idea." An idea can be stolen, adjusted, or modified without giving due credit. This is a risk most innovators are willing to take if the idea is accepted even though credit is lost to them personally. We attempt to respect the confidentiality of all proposals until approved.

An idea must be ordered into a certain usable and understandable structure before it takes sufficient form for operation. This structure usually starts with some form of a preliminary letter or statement. We ask for a beginning statement of an idea and then work with the individual to develop it into proposal form. A sample preliminary statement is included in Appendix (C). As the proposal is planned it should emphasize certain points. Krathwohl points out that the actual physical structure of a proposal is important. The eye transmits more easily to the brain those points which are underlined, capitalized, or indented for special emphasis. Many proposals are really not understandable because the originator does not communicate well in written form or the idea is not presented in a logical way.

We require a standard form for the proposal document based on instructions contained in a procedure manual. Application for support is made by submitting the properly executed application form and the formal proposal in triplicate. If the request for support is approved, the application form serves as the contractual agreement between the identified school or agency and the State.

The writer should address himself to the vocational education significance and economic efficiency of the proposed project. The design, purpose, content, and procedures should reflect his awareness of such criteria.

The following guidelines are generally applicable, regardless of the magnitude of the proposed project, the area of investigation, or the authorization under which the project may be funded. The applicant is expected to make judicious adaptations of this format to accommodate the kind of activity he proposes to undertake.

I The Cover Page. Use the standard Application form. Appendix (D)

II The Abstract occupies a single page, identifies the proposal, and concisely and simply summarizes the contents. The summary portion of the abstract has

three parts: A statement of the purposes, objectives, or nature of the project; an indication of the expected contribution to education; and a compendium of procedures or description of what is to be done.

III The Rationale will include the identification, relationship to vocational education, background, definition, objectives, delimitation, and need for the project.

IV The Body of the proposal communicates the Project Director's plan and its probable effectiveness. This will include the activities and curricular content to be used in the classroom or field experiences. The procedures will include the plan of action envisioned to investigate, coordinate, and implement the proposed activities. The population to be studied or treated as well as facilities should be given attention.

V Personnel will include the name, title, and a brief statement of the pertinent experience and unique qualifications of the principal investigator (s). Include information about other key personnel when possible. State percent of time on the project and per annum salary.

VI The Evaluation will include the techniques to be used in determining effectiveness. Expected findings may be suggested.

VII Dissemination. Indicate how important findings should be disseminated and the audience that should receive this information.

VIII The Budget, should follow guidelines established for fiscal management of educational funds. The code numbered items shall be considered as line items in the project. Estimated expenditures should be itemized under each line item. The applicant should show reasonable estimates but be detailed enough to suggest careful analysis of expected costs and understanding of fiscal responsibilities in connection with conduct of the proposed activity.

520.7 Travel

520.9 Other

In proposals for exemplary programs, the rationale for need or background may often be achieved by reviewing a similar activity or a prototype which has already been used in another setting. This would be followed by a plan to modify, adjust, or replicate the project within your own situation. As you have heard earlier this week, exemplary programs are not always ariginal. Definition of the problem can be based on the report of findings from a previous project. A report of an experiment which was used as an acceptable rationale for a funded exemplary project is included in Appendix (E).

Someone has to put a proposal together. Although many people can prepare parts of a proposal, individual effort by one person will make it an entity. As an example of the kind of thing not to do, I refer to an Illinois conference on research methodology, which we conducted a few years ago. We divided our group into committees of approximately 15 each and asked them to prepare the abstract of a developmental project. In one group we had almost all school administrators, and I remember well that it took them over three hours to decide on a problem and how it should be stated. It ended up with this title: "An Experimental Program to Escalate the Economically and Sociologically Disadvantaged Youth at the Secondary Level." In that committee, the arguments were strong and long about whether the project would be experimental, whether they should say escalate, whether it should be limited to the secondary level, whether both economically and sociologically disadvantaged should be included, and so on *ad infinitum*.

Instead, let me report to you excerpts from a very excellent proposal which was submitted primarily as the idea of one individual. Adjustments and modifications were made by our staff as well as by other experts whom she chose to involve in the development of this proposal. Her "experts" ranged from a high school sophomore to Dr. Donald Super and Dr. Anne Roe. The original activity outline was presented by Miss JoAnn Harris as an idea for computerizing vocational guidance services at Willowbrook High School. Her proposal outlined the problem by stating:

> "It has long been recognized by guidance personnel that counseling young people about vocational choices and job opportunities is one of the most difficult facets of their work. Besides the changing nature of the students' interests, we face the problem of gathering, organizing, updating, and making readily available the mass of general vocational information, specific job opportunity

data, and training opportunities. We cannot minimize the "growing pains" which the student must experience, but we can effectively grapple with the mass of information by use of modern computer technology. We propose, therefore, to lay plans for the gathering of all such information; conversion of it into data processing form; and relation of it to all that we know about each student for the purpose of more accurate and extensive vocational counseling. We do not propose to replace the counselor by a machine, but rather to make accurate, updated, comprehensive information immediately available for human consideration."

She listed objectives:

1) To continually gather general occupational information and to keep it current and updated.

2) To make all such information immediately available to counselors and students, as individuals or in groups.

3) To help prevent dropout and to help students make wise choices in regard to vocational offerings by the effective presentation of such material early in the student's high school experience.

4) To keep information about vocational schools, apprenticeships, and other training opportunities current and readily available.

5) To gather, organize, and communicate information about local entry positions and training opportunities, including at least all of DuPage County.

6) To make and evaluate full and part-time job placement.

7) To improve the basic skills of the culturally deprived to at least minimum employment level.

8) To continually gather and quantify information about the vocational placement and success of our graduates and school-leavers for the purpose of evaluation of guidance and adjustment of curriculum.

9) To provide continuous in-service training for administrators, counselors and teachers.

10) To be able to make meaningful relationships between the information we know about each student and his vocational choices.

She listed the plan of the study in very short form and then divided into several phases the programming and operation of a computerized system. Personnel and budget were included as well as the facilities and hardware which were needed and available. From a very small original proposal of approximately four pages has come a COMPUTERIZED VOCATIONAL INFORMATION SYSTEM which is probably the most advanced system of its kind at the present time in the United States. It is now in operation at a cost of approximately $150,000.

Many proposals surely are written to provide ego value for the individual who is named as the principal investigator, or the project director who has the responsibility for implementing the idea. The best proposals are concise, cogent, and written in relatively simple language. Some are "tricky" and rely on popular key words and phrases. Not long ago taxonomy, experise, praxiological, vertical, schema, variables, modular, validity, and paradigm were "in." Now a new set certainly includes cybernetics, the systems approach, sensitivity, self renewal, involvement, simulation, and surely will soon include, exemplary. This can easily be overdone. A "Systematic Phrase Projector" patterned after a recent article in Time magazine uses any three digit number to select a word sequence. The phrase can be dropped into virtually any proposal to give it a ring of decisive authority. But a problem arises when no one has any idea what the combination means. I like 705 which is synchronized management concept. Such a system offers unlimited combinations!

Column I	Column 2	Column 3
0. integrated	0. management	0. options
1. total	1. organizational	1. flexibility
2. systematized	2. monitored	2. capability
3. parallel	3. reciprocal	3. mobility
4. functional	4. digital	4. programming
5. responsive	5. logistical	5. concept
6. optional	6. transitional	6. time-phase
7. synchronized	7. incremental	7. projection
8. compatible	8. third-generation	8. hardware
9. balanced	9. policy	9. contingency

It seems to me that one of the desirable facets of proposal preparation is its condensation into a one page abstract form. It is quite unlikely that most proposals can be presented fairly in such a small space but it is possible to condense the significant portions into a one page summary. I heard some time ago of an industrial concern which insisted that every proposal, even if it projected an expenditure of as much as a million dollars, should be no more than one page in

length. This is probably too restrictive but many proposals are much too long. Proposal writers sometimes seem to have a general constipation of ideas which they try to cure with a diarrehea of words. I suggest, "As you prepare your proposal, unencumber from ambiguity and make perspicuous for thus, in excising the superfluous your treatise becomes succinct and compendious. In other words, be *clear, concise,* and *brief.*" Our short but simple advice is COMMUNICATE or EXCOMMUNICATE.

Many exemplary programs may in reality be a part of the spectrum of research. If research is defined as those activities from theory development to the implementation of new procedures, then exemplary, innovative, experimental or field test activities are all a part of this spectrum. In any case, the research syndrome is likely to apply to requests for funding of exemplary projects. This research syndrome is characterized by the story of the research director in an industrial research center. He seemed to have all of the material things that any researcher could wish for. And when his visitor commented about this obvious affluence his answer was, "No, I do not need unlimited resources for good research. All I need to carry on significant research is what I ask for." It is unrealistic to believe that exemplary programs will be successful in every case. It is equally unrealistic to believe that unlimited resources will guarantee exemplary programs which are excellent. For example, the student treatment programs which we have funded added an average of approximately $330 per school year to the normal per capita cost. This is more realistic than the $9000 per year reputed to be the cost of an average Job Corps enrollee. Exemplary programs can and should be budgeted at reasonable added cost.

When a proposal is submitted to the funding agency which will generally be a State department of vocational education, or through a State department of vocational education to the Commissioner of Education, then a certain amount of review, revision, and pain of adjustment is always necessary. The proposal preparer should be ready to *review, revise,* and *reflect.* Almost always a reduction of funding is requested and hard decisions have to be made on what is most important and what to cut out. This has established another facet of grantsmanship that is often characterized by "ask for more than you need because when you get cut down you can still live with the contract." This works if the original asking is not so great that it causes disapproval on the first submission. There must be a fine line somewhere to determine what the maximum asking will allow, and at the same time be prepared for the minimum on which to operate. A more realistic approach is often to search for supplemental funds from other sources. We have been very successful in obtaining 25% the cost of exemplary projects from local funds. We do not believe it is reasonable to expect a local school to experiment, to try expensive ideas which may not prove workable at their sole expense. And so, as we provide some of the risk money, local people have willingly accepted the additional costs. Often this is no more than they would otherwise be paying for traditional, regular, and in many cases, relatively unsatisfactory programs.

Every proposal should include in its structure the objectives and how the project will achieve those objectives. Evaluation can be based on the degree to which objectives are achieved. There must be some escape valves, there must be some freedom. The person who is attempting to conduct an exemplary program must be provided sufficient freedom to change, adjust, and modify during the course of a project. Exemplary programs, like many other kinds of research, will likely never be completely regularized in their existant form. Some will be modified to existing formats and procedures, others will be fitted to operational structures, and still others will cause the change of formats and administrative procedures in order to accommodate them.

The true *imagineer* who has developed an exemplary program must not have spastic tenensitis. He must be willing to let go; he must be willing to turn an idea over to another who will continue to operate it; he must use his talents back at the drawing board to start over with a new and refined or adjusted and an improved idea that will offer still greater results. This necessitates that exemplary programs not become *my* project, from *my* proposal, with *my* students. The person who operates an exemplary program must have some other kind of security blanket than self identification with one specific idea. I mentioned earlier the ego value of a proposal. There is an ego value in being able to move from one idea to another. The "idea man" is much in demand as a developer. He does not stay with the same idea for his entire life. I knew a man who a few years ago took credit for an idea and most of its development which led to a specific vocational program in Illinois. It was started forty years ago. Unfortunately, when he died in 1967, the program was almost identical to its inception in 1927.

The operator of exemplary programs must be committed to putting ideas to work. An excellent national conference was held not long ago for governmental employees entitled Putting Research, Experimental and Demonstration Findings to Use. I have included a two page summary from that report in Appendix (F). Until exemplary programs for vocational education are put to work and in turn put people to work, we have failed!

The complete system we used to administer and operate research and developmental projects is diagrammed by a flow-chart covering the continuum from *idea* to *implementation* in Appendix (G). It is a system I commend to you from experience, trial, and error for the administration and operation of exemplary programs.

Summary

Once an exemplary program works, where do we look for the next idea? Probably to the same person who started one a few weeks, months, or years back. Some people are creative, others prefer to be implementers. *Imagineering*, like many other activities, becomes easier

with each passing experience. An exemplary program can be the training ground where another individual is imbued with the spirit of innovation, improved methods, and new ideas. If an *imagineer* develops and trains another person to structure an exemplary idea into a workable form this may be a greater achievement than implementing his original idea.

Most of us must admit that we steal more ideas than we originate. Many exemplary programs are waiting to be stolen and modulated from previous ideas that have been tried, field tested, or dreamed by others. I hope you feel a responsibility to support, modify, adjust, administer, and operate the ideas and prototypes that have been reported to you at this seminar. If you go home with a dedication to utilize these models, or to develop others, and then to establish a system of operation for exemplary programs, we have made a great forward leap toward the implementation of this part of the Vocational Education Amendments of 1968.

What are we searching for?

Where is the great idea?

Which exemplary program will remake vocational education?

If $13,000,000 is appropriated by Congress for Part D of the Vocational Educational Amendments of 1968, this will only give us the money to start a search for the *Holy Grail* of vocational education. We have not yet found that one proposal, one project, one man, one idea, one speech, one action, or one program that is a gleam of the millenium for vocational education. Exemplary programs offer us the chance to go home and search.

Appendix C-i

"PRELIMINARY STATEMENT"

Project "II-ON"

RATIONALE

As programs for the education of retarded and slow learning students develop, the need for more emphasis on preparation for employment becomes increasingly apparent. All to often this emphasis is ignored until the student is in high school. A vocational program which serves as an effective preparation for and as an adequate transition to employment should begin at the elementary level. Needed pre-vocational skills, abilities, and attitudes do not develop on their own, but require a comprehensive program to facilitate their development.

PROJECT ACTIVITIES

Develop a curriculum that is vocationally orientated commencing at the fifth grade level or within the eleven year old age range and proceed in an organized fashion through the high school phase. This will necessitate changes in administrative views as well as teacher philosophy and require changes in classroom design. Expand the present high school work study program to offer more diversified experiences by creating job training facilities that are not available in this area. To insure the maximum development of students' vocational potential it is deemed feasible to plan a summer program which will continue and supplement the regular school program.

PROCEDURES

At the elementary level four (4) intermediate EMH classes will be housed in new classrooms which are designed to include pre-vocational training areas. (See attachement I)

This physical plant will enable pre-vocational training to become a planned and an integral part of the students' daily program.

At the junior high level an integrated program for the EMH and slow learning students will contain daily class sessions in occupational training which will include a session of time each semester for a job work experience within the junior high plant.

At the high school level the present EMH work-study program will be expanded in two (2) areas: The first will add junior and seniors who are not eligible for EMH placement but who are failing to achieve in the regular curriculum. The second area of expansion will be in types of job training stations. Areas which are not available in the community for training will be developed within the school setting. Initially this will include programs in cabinet making, electrical repair, machine shop and printing. In the long range plans it is hopeful that other areas will be included primarily those in the building trades.

MEANS OF EVALUATION

Periodical testing to include manual dexterity development, visual motor, and interest aptitude test will be administered. Development of norms which are meaningful to retarded and slow learning students in the above areas was begun under a Title VI grant during the summer of 1968 and hopefully will be finalized under a continued grant during the summer of 1969. This along with teacher observation and progress reports will constitute the basis for evaluating the program.

PROFESSIONAL STAFF BUDGET

September 1 through July 31

4 Elementary Vocational Teachers	10½ months @ $5,250	$21,000	
4 Junior High Vocational Teachers	10½ months @ $5,250	$21,000	
7 High School Vocational Teachers	11 months @ $5,750	$40,000	
			$82,250
75% of Student Wages			$10,000
80% Travel			$ 576
75% Supplies			$ 1,200
		TOTAL	$94,026

APPLICATION FOR SUPPORT OF RESEARCH
AND DEVELOPMENTAL ACTIVITIES IN VOCATIONAL EDUCATION

I. School or Agency _____

Superintendent or Responsible Administrator _____

Address _____ Telephone _____

Project Director or Principal Investigator _____

Address _____ Telephone _____

Project Title _____

_____

_____

Estimated Budget _____ Duration _____ to _____

II. Abstract.

III. Problem and Objectives. Outline the rationale which initiates and supports this proposal.

IV. Procedures and Activities. Includes the plan of action and outline of methodology. Attention should be given to population and facilities.

V. Personnel and Qualifications. Experience, skills, training, and time allotted.

VI. Evaluative Procedure to be followed.

VII. Method and Scope of dissemination of pertinent data and results.

VIII. Estimated budget requested for this proposal itemized by major headings.

Project Classification by RCU _____

IX. Agreement

Approval for reimbursement from vocational funds is requested as described in Sections I and II of this application. This project is designed to advance existing vocational and technical programs and/or to develop new concepts of vocational education. Teaching personnel involved in the project will meet State of Illinois certification standards.

_____
Superintendent or Responsible Administrator

_____
Title

_____
Date

X. Approval

Approval is hereby recommended for the foregoing proposal based on review, discussions, and/or on site investigation.

_____ _____
RCU Consultant Date

Reimbursement will be made from State and/or Federal vocational education funds at the rate of _____ % for expenditures within the limits of the $_____ estimated in Sections VIII. Reimbursement will be made upon receipt of claim showing expenditure. Transfer of funds between line items in the budget is allowable (not to exceed 10% of any line item) providing this does not change the intent of the proposal nor increase the total budgeted figure. Money can not be transferred for purchase of equipment. Other adjustments and/or modifications are subject to review by the RCU and approval by the State Director.

AN EXPERIMENTAL VOCATIONAL EDUCATION PROGRAM IN URBANA JUNIOR HIGH SCHOOL

Basic History

The vocational education program at Urbana Junior High School, Urbana, Illinois, was designed basically as a sheltered workshop experience for 8th and 9th grade boys and girls who were potential dropouts. (Operation began with the opening of school in September, 1966.) Last year the students were scheduled for 2 hours of class in the shop (Phase I) or 2 hours of in-the-building cooperative job training experiences. (Phase II). In Phase I the vocational shop training consisted of experiences designed to teach the students how to use hand tools and basic production machines by means of both individual and production type work. Phase II consisted of on-the-job training in cooperation with the academic staff and the non-academic staff in the cafeteria, physical education department, library, bus lot, offices (administration and guidance) and the custodial division. These students spent the remainder of the school day in classes, such as English, math, social studies, P.E., and science. These students are grouped with other students who have similar achievement and ability levels.

OBJECTIVES

The nine objectives of the program consist of the following:

1) to develop skills in reading, writing, spelling, speaking and computing to maximum levels for each individual as they relate to vocational competence;
2) to develop good work habits;
3) to develop a better understanding and acceptance of himself, his family, the school and community;
4) to improve attitudes toward himself, his peers, his teachers and his parents;
5) to provide real and practical work experiences;
6) to meet the needs and interests of students;
7) to improve social skills — appearance, manners, and social participation;
8) to establish realistic educational and vocational goals;
9) to achieve improvement in concept of self.

IDENTIFICATION OF NEW STUDENTS CRITERIA

Criteria used in the selection and identification of the students who would participate in the program are listed below:

1. overaged and/or educationally retarded;
2. teacher referral for:
   a. slow learner
   b. lack of goals
   c. refusal to accept existing program
   d. refusal to work in group assignment
   e. poor social adjustment
   f. extreme discrepancy between achievement and measured ability
3. showing potential dropout characteristics:
   a. a broken home
   b. an irregular attendance pattern in school
   c. parents are unemployed or in unskilled jobs
   d. parents were dropout themselves
   e. attendance at several elementary schools
   f. low economic level

Appendix F-i

PUTTING RESEARCH, EXPERIMENTAL AND DEMONSTRATION FINDINGS TO USE

U. S. Department of Labor, November 28-29, 1966

1. Stimulate good research proposals by (a) streamlining grant and contract procedures, including providing a small planning stipend after approval of an informal proposal, and by (b) inviting and reaching out for submission of proposals in a given field to assure desired complementary studies and needed coverage of given subjects, not just waiting for proposals to be submitted.

2. Prepare and distribute to potential users comprehensive but succinct periodic reviews of the state of the art/knowledge in given fields. In these reviews, point up gaps which might be filled by Research and Development (R & D) or Experimental and Demonstration (E & D) projects.

3. Ask and try to answer continuously, from inception to completion of a project, the questions of its aims and ultimate use of results. Whom is the demonstration intended to influence? What are the obstacles to the good use of results, and how can these obstacles be overcome? What criteria should be used to evaluate the results? When these questions have been tentatively answered, either before the project begins or at the start, bring in representatives of the identified program group who might be expected to utilize the findings (in addition to requiring that each proposal include recommendations by the sponsor on how to implement the findings of his project). The representatives will meet with the project staff and funding agency program officer, for consultative reactions to the tentative answers. These persons may well be helpful with practical advice not only regarding possible improvement of the project, but also regarding appropriate ways of interesting potential users or colleagues in their own field.

4. Provide for continuous interaction between grantor or contractor and grantee, from the beginning of the project through the period of dissemination and efforts to apply results. This may imply more technical training for Washington agency staff; more staff devoted to keeping in contact with projects and stimulating use of results; better interagency coordination; development of a clearinghouse and data retrieval system similar to that now in use by the Office of Education.

5. Provide in the project methodology a built-in component on reporting procedures and statistical data which would permit subsequent evaluation and utilization.

6. Summarize findings in separate, brief, nontechnical, and very readable reports, in addition to the full technical reports. Get criticisms of at least the summary reports from key representatives of potential users before they are put in final form. Then disseminate them widely to members of the various groups of potential consumers.

7. Conduct seminars in conjunction with site-visits, where potential users can discuss the innovation, perhaps see it and "feel" it as something alive, and consider its applicability to other situations. The participants could have small group discussions of ways to adopt

and perhaps to improve the innovation. Encourage each participant to tell about innovations in his own facility. Thus, each participant can become a giver as well as a receiver of information.

8. Reduce wasteful proliferation and fragmentation of research, demonstrations, services and research utilization efforts by developing better interagency exchanges to discuss policies and problems as well as projects already underway or needed to help fill gaps in knowledge. Agencies also could work out common as well as unique strategies for utilization of promising findings. The more complex our society becomes and the more specialized the focus of different groups, disciplines and agencies, the greater the need for system integration to relate the parts to the whole.

9. Replicate important demonstrations as a means of accumulating more experience and, through reaffirmation, giving them more impact.

10. Identify and recruit key practitioners in various localities to apply the innovation to their own settings. Their example might be expected to foster adoption among others with whom they are influential. To facilitate application of the innovation, provide human links or change agents who are thoroughly familiar with it to serve as consultants to the institution which is interested in exploring, adopting or adapting the innovation. Use the project staff, where appropriate, for this change agent and consultant function.

11. Invite attention to the potential rewards of adopting the innovation — for example, winning approval from key persons or sources, gaining prestige, reducing costs, improving services — so that the potential user can identify them with his self-interest.

12. Obtain policy commitment from funding agencies to the idea that dissemination and utilization functions are an integral part of their research program. Implement this commitment by providing each research-support operating division with a dissemination and utilization staff of its own, in addition to an overall Bureau or Office capability. This operating division staff would work with agency program officers and sometimes with the demonstration project staffs to see that their procedures contain evaluation, dissemination, and implementation components. Unless steps are taken to promote implementation after research and development, and unless someone is responsible for seeing that such steps are taken, considerable lag can be expected.

13. Evaluate the financial considerations involved in putting project findings to use; e.g., the extent to which the project might supplement or support existing, ongoing practices or services; the cost-benefits involved; the distinctions between the costs of adopting the critical or essential elements of a project and adding those which are marginally valuable.

An Administrative Flow-Chart For Research And Developmental Proposals

EVENT IDENTIFICATION

1 - Idea generated by local researcher or project director.
2 - Completion of a brief summary of Idea.
3 - RCU consultant reviews Idea.
4 - RCU Coordinator approves continuing work to develop Idea.
5 - Amplification of details for use in preparing Proposal.
6 - Proposal developed; approved by local board; signed by chief administrator; and submitted.
7 - Proposal checked for validity, completeness, acceptability, allowable expenditures by RCU consultant.
7a- Status report reviewed and evaluated.
8 - Research or experimental committee reviews Proposal.
9 - Review committee obtains pertinent information from substantive speciality and other experts.
10 - Proposal signed by coordinator and prepared for submission to Director or return to originator.
10a- Request for revision, adjustment or continuation prepared for further action.
11 - Submit to other funding agency.
12 - Director receives proposal for consideration and action including revisions and technical adjustments.
13 - Disapproval and return to originator.
14 - Director informs Board of Vocational Education and Rehabilitation of projects approved and continued.
15 - Letter for original project approval from Director with specifics of the authorization.
15a- Letter from RCU consultant transmitting extension, continuation, or amendment as approved by State Director.
16 - Reimbursement based on claim of expenditures.
16a- Reimbursement based on amendment, adjustment, or continuation.
17 - Disposition through continuation, regularization or termination.
18 - Audit of reimbursed expenditures (State and Federal).
19 - Final report (at conclusion of project only).

What Happens To An Idea?

Edward M. Vass
Project Development Consultant
Illinois Research Coordinating Unit

Before I answer the question "What happens to an idea?" let me answer the question "What is an idea?" I contend that an "idea" is an activity which is subject to research.

When I discuss what happens to an idea, I am discussing people; because an idea, as an activity subject to research, is a human activity. Consider an idea in its infancy as a verbal or nonverbal manifestation of a particular intellectual refinement. Identify the intellectual refinement as a mental set resultant of training, education, and/or experience. As the idea takes form, the mental set responds; and, collectively, the responses will determine the order of the action to be taken. Responses are also indicative of the personality, which will meet the task of adjusting to the existing environment to which the action is directed. Therefore, I remind the reader of the basic psychological and physiological inputs which affect what happens to an idea.

The application and utilization of research designs denote an activity with value. An idea being researched acquires the nuances of an educational endeavor requiring certain value judgements. Quantitatively, an idea has educational value when it becomes an operational activity. I

feel the majority of my colleagues would agree that an activity must be measurable if educational value is to be established. The difficulty is that, many times, when one classifies an activity as operational, one is closing the curtain on the final act of intellectual inquiry. I believe that the implementors of ideas take a value-free posture and maintain that posture to the point where they will reject reality to save the model which made an idea operational.

How important is the truth of reality? If there is no correlation between the activity and the basic needs of the population for which the activity was structured, can the educational value be measured? Shouldn't ideas which have taken operational form contribute to or correspond with those needs? No activity should be above continuous evaluation and research. To develop and maintain a meaningful correlation between an activity and the needs being served, educational models must provide research mobility in any direction.

I submit that, to develop such a model, one must:

1. Subject an idea to basic research; evaluate, terminate, or modify the idea as the findings dictate;
2. Subject the modified idea to applied research;
3. Subject the findings to evaluation; terminate, modify for additional basic or applied research, or phase into an operational format;
4. Subject operational activities to a re-cycling on the continuum, thus providing mobility in either direction.

The design need not be complicated. Observe:

1. Basic Research
2. Applied Research
3. Termination
4. Modification
5. Evaluation
6. Operational

Conceptually, a research continuum which provides mobility is educationally significant because an idea can be evaluated at any point on that continuum, modified, and/or subjected to additional research. Consequently, the value of research is enhanced and operational activities become more meaningful. Few researchers believe that an idea which has become an operational activity is an absolute or destined to remain as a universal truth forever. When an educator realizes that an operational activity has no contemporary value or need, he should subject that activity to the same processes which brought it to an operational state.

Consider the following propositions:

1. Education is an idea in action.

2. Educational standards provide the environment which will enable an idea to flourish or cause it to perish.

Historically, concerned men have accepted the challenge of education and provided an environment in which it would flourish. Other men, with more selfish concerns, have tried to bring about its demise; and in some instances, education perished. I realize it is an over-simplification, but that is what happened to one idea.

To utilize the model I have developed, certain judgements must be made. These judgements are dependent on the individual's responses to stimuli. I must regress to sum up the total of that activity called an idea. Thinking is not based on external stimuli alone. There is a constant interface between internal judgement and external sources of data. To understand this relationship, one develops a sensitivity to problems which engenders ideas. If a person does not possess this sensitivity, he lacks what some call "problem awareness," and as a result, suffers from "problem blindness." What happens to his ideas? Many accuse researchers who research for other researchers of problem blindness. Curiously, this condition might result from one's attempt to become sensitive to problems; because the only way it can be accomplished is by making a number of value judgements. Those who employ the scientific approach to an idea may be guilty of problem blindness. The scientific approach should not be overemphasized where value judgements are prominent. Education and the research of educational activities are laden with value judgements. Anyone who interprets research data as a basis for action within the educational community is making a value judgement.

Pragmatically, it is impossible to postulate without concern for the value of the initial idea. The most sophisticated dialectician is subjective in his methods, and critical study is only a study of the data which are available.

I feel, in addition to the need for research mobility, engineers of educational activities should emphasize not the permanency of those activities, but their applicability at that particular time--the idea being a timely answer to a dated question. What happened to that idea?

MEETING SPECIAL NEEDS OF THOSE WHOM WE SERVE

by L. C. Dalton
State Supervisor, Agricultural Education
University Park, New Mexico

In preparing for this symposium, I could see where the subject could cover many different facets of our Agricultural Education Program. I am going to confine my talk to those special problems that teachers of Vocational Agriculture in my State have to cope with, which are similar to problems that teachers have in other States.

A large percentage of the students in Vocational Agriculture in New Mexico are from low-income families, which earn less than $3,000 per year, and who also have language barriers that would not be found in other States. A large percentage of the parents of these students are on the relief rolls of the State and have been on relief for more than two generations. In coping with the problem of poor attitude, lack of responsibility, letting somebody else make the decisions and furnish the money, the students of these parents have a problem in our Vocational Agriculture Program to do the things that we expect from a regular student from a farm family who receives all of the income from the efforts of their labor. The students from these families do not have money to pay FFA dues, buy an FFA jacket, secure a farming program or buy materials to build equipment in the Farm Mechanics Program.

Some of the schools paid the dues for these members thinking that this would motivate and develop them as good citizens, but it did not take us long to find out that they thought this was another give-me, and did not respect the organization.

The next approach that teachers tried was providing jobs around the school or in town for these students so they could make enough money to pay their FFA dues and purchase their FFA jackets. This method developed some responsibility, involvement in FFA activities, and they became better members of the Vocational Agriculture classes and the FFA.

Another innovation that is being used in New Mexico and other States to get involvement of all the members in the chapter is to have each member assigned to one or more activity during the year to plan and carry out the activity, make reports

and receive commendations. This procedure has made this segment of our membership in the FFA become stronger, better educated with more responsibility and a chance of becoming better citizens.

So many times these low-income students have no knowledge or background of the subject that is being discussed in the classes so more field trips, laboratory exercises, learning by doing is a procedure that will get them involved in the learning process and through motivation they become more interested in the problems and in learning to make decisions, which they have never had to do before.

We believe that segregation of these students from the high achieving students is wrong since they would not have to compete with anybody but themselves and they would see no higher goals or different ways of doing things.

Teachers motivate these students by improved methods of instruction, transparencies, slides, pass-out material, along with the field trips and demonstrations. The teachers also spend more time on inidividual conferences and visitations with these boys and their families than they do the others to get them to the level that is expected.

The Farm Mechanics Program is another problem area since these students have no funds, no background, no initiative, to build or make or do anything. In New Mexico, the course of study in Farm Mechanics during the first two years is built mainly around developing skills in which all the supplies are furnished. This creates no problem as far as the low-income student is concerned for the only thing that is necessary is to motivate better workmanship and safety among these students. They have the habit that if it is half done, it is good, but the teachers in New Mexico are emphasizing through contests and other procedures the value of craftmanship, neatness, and safety in the work.

In the third and fourth years, when the students begin to build individual projects that we require in our course of study, is where the main problems in Farm Mechanics with this student starts. The teachers in New Mexico through extra work and effort, locate farmers and ranchers or other people who need projects constructed, to furnish the materials for these students to construct, and in many cases pay the

students for their work.

Another innovation in many of the schools is to furnish the materials to construct such items to be sold or auctioned to people in the community, the proceeds being used to pay for the materials and the remainder to go to the FFA fund or being paid to the members constructing the projects.

The farming programs or supervised practice programs of students of this group cause more problems for the teachers in New Mexico than any other area. The teachers use pig chains and sheep chains to provide animals for the students. They become enthused and do an excellent job until the project grows to such an extent that the parents are afraid that they will be removed from the relief rolls by their sons having these enterprises and making money, so the next thing we know, they are sold, eaten, or gone, and the enthusiasm of the students drops to rock bottom because of the evils of relief.

Some of the departments are setting up cooperative enterprises either in feeder swine, feeder sheep, or feeder beef using the FFA fund to purchase the animals and buy the feed for the enterprise with the low-income students feeding them, keeping books, taking care of them during the feeding period, and when the animals are marketed, the money goes to pay the cost of the feeding, with the remainder going to the students. This has developed a lot of leadership, responsibility, and initiative that would not be accomplished if the cooperative enterprise had not been used. The teachers have found that they can get better results by having the students in a cooperative effort on the livestock and being responsible for feeding, taking care, management, and marketing of their animals than they would if the school owned the enterprise and the students just worked for the school in care and management of the animals.

Another method that is being used in the State, although it does not develop as much enthusiasm and responsibility as a cooperative enterprise, it develops good work habits, relationships, and a sense of doing something worthwhile, and that is the placement of students on a farm or ranch for experience. The only

problem in the areas where we have low-income students, there are few farms or ranches in that area large enough to use students. Many schools do not have finances in their FFA fund or school fund to carry on many of the activities that are necessary for the low-income students, so it is necessary to secure finances from banks, individuals or groups of individuals to finance these programs.

Another need of many of the students who are low achievers or who have poor reading ability is to get them to comprehend what is being taught in the class. This is where teachers use individual efforts, individualized instruction, and resource people to meet the needs of the low achievers and high achievers. The teachers in New Mexico are finding in working with these special groups that they are having to use more programmed instruction to keep the students at the level of their ability without them losing interest and dropping from the program.

We have found that we can get better results in developing these students when we make them feel they have a place in society and that they can become an educated person with chances to succeed and make money, and they have a place in class and are involved in the activities of the FFA and the class and help make decisions and carry out activities, they become good citizens the same as those who come from families who have higher incomes. It takes a teacher with more patience, more perserverance, more initiative and willingness to try out new methods and innovations and spend more time preparing instructional materials so that they will be able to motivate students from this group. In the end, they can see more progress from working with this group even though it is not as satisfying as working with families who appreciate it more than families from this group.

If we are to combat the inertia, the mental attitude of the people of this group, we need to spend extra effort, work and use every avenue we can think of to make tax-paying citizens out of these youngsters.

Individualized Instruction
in Vocational Agriculture

Raymond M. Clark

Presented at the Agricultural Education Section
AVA Convention - December 13, 1968

I think it is just ten years ago that I was given the opportunity to report to this group on a little study we had done to determine the "Need for Training for Employment in Non-Farm Agricultural Business in Michigan." There is no point in reminding ourselves of this except to emphasize how far the vocational agriculture professional group has gone in these past ten years. As a professional group, we have moved from the point of trying to identify what employees in non-farm agricultural businesses need that is the same, or different, from that needed by those planning to farm, to a point where we have deluged ourselves with curriculum guides and lists of competencies needed by workers in agricultural occupations. We have expanded the vocational-technical training to a very extensive post-high school system of area vocational schools and community colleges, so that we now have a six-year vocational-technical program of agricultural education, plus the more or less traditional young farmer and adult-farmer classes. We not only have expanded our offerings, but also we have opened our doors to any one, boy or girl, farm or urban, regardless of race or creed, who has an occupational objective in which a knowledge of agriculture is desirable.

In the few minutes we have today I would like to describe (1) the situation as I see it today, (2) the project on individualizing instruction at Michigan State University and (3) finally to express some thoughts as to next steps in the development of our agricultural education program.

As a result of these changes, we have in high school classes today individuals with a wide range of occupational objectives. We may find in the same class students with such occupational objectives as:

1. Livestock farming
2. Dairy farming
3. Crop farming
4. Truck farming
5. Nursery operation
6. Feed store employee
7. Garden Center employee

and many others. Even if we are able to offer a fair number of "specialized" courses, we will still have a variety of occupational objectives among students in a class. For example, the Center for Research and Leadership Development in Vocational-Technical Education at Ohio State suggests the following modules for a course in Agricultural Business - Sales and Service. Think of the great variety of occupational objectives possible in the suggestions for this one course. The modules included in the course are:

Feeds	Agriculture Salesmanship
Fertilizer	Organization and Functions of agricultural Business
Petroleum	Crop and Garden Seeds and Supplies
Business Procedures	Horticulture Sales and Service
Human Relations	Miscellaneous Agricultural Supplies-Sales and Service
Agricultural Chemicals	Orientation to Occupational Experience

This background is sufficient to indicate that a point has been reached where we must develop ways to meet a wide variety of occupational objectives in the same class.

At Michigan State we are working on programs to individualize instruction so that students in the same class may study different materials, make application of materials to different situations and in different occupations and yet remain as members of the class by having opportunity to report from time to time on significant activities in which the individual has been engaged.

Our first attempt was reported in February 1968, at the Central States Seminar in Chicago. It was titled, "A Pattern for Individualized Instruction in Grain Grading." In August the Vocational Education Office of the Michigan Department of Education subsidized ten selected teachers of agriculture to attend a workshop conducted by the university in which each man prepared a manual on one unit of an Agricultural Business-Sales and Service program. The units are all built on the same format. They include the items shown on the transparency.

Transparency 1:

These involve:

1. The statement of the unit or problem (transparency 1)
2. The statement of objectives
3. The introduction to the unit --- a list of lessons
4. For each lesson
   a. Text material
   b. Suggested instructional materials
   c. Suggested student activities
   d. Evaluation activities and procedures
5. References

We think of the pattern in diagramatic terms as shown in this transparency (2).

Transparency 2:

You will note that here we list the title and a series of behavioral objectives---the kind of thing that we expect students to be able to do and to apply when they have finished the unit. The text or reference material may be either on tape or in printed form or both. We expect the student to work from his manual to a series of visuals including such things as slides and specimens, field trips, etc. He may work back to his manual and then go into a laboratory or field demonstration where he can put some of his information into practice. We would expect him to work on plans for his occupational experience and finally into evaluation. Note that we aim to develop a manual together with a "package" of all the references, visuals, audio visuals, demonstration materials and other items to enable a student to follow through the unit on his own, but always under the guidance of the teacher.

Transparency 3:

Transparencies 3, 4, 5:

In transparency (3), our idea is that some of the student activities will be carried out as a total class program; some in small groups; and some as individual activities and in transparency (4). In the example, in a unit on salesmanship, the whole class might be working on such things as pre-approach, attitude of the salesman and personality factors. Small groups might work on application to Feeds; Fertilizers; Power Machinery; etc, according to the occupational objectives of individuals and as shown in transparency 5 individuals might work out plans for sales or service in more or less real situations.

I want to emphasize the cooperation we have had in the development of these units. We not only have the wholehearted support of the staff in vocational agriculture at the university and in the State Office, we also have cooperation of appropriate technical people in agriculture and in the distributive education staff.

Many times these people point out that we need to modify and up-date our materials. In some cases they point out that the material prepared by the teachers is inaccurate in terms of the most recent research. This has been true for both the Distributive Education staff and the technical staff in agriculture. It emphasizes the necessity to keep our technical materials in tune with local agricultural technology.

In all cases, however, we have held to the idea that the agricultural education staff would control suggestions regarding methods of teaching and learning activities of the students.

During this year the ten teachers are trying out some of these units in their classes and will report on their use next spring. We plan then to re-edit the units, making as complete packages as possible and to prepare them for distribution to all the teachers in the state.

3. Analyze Grain					

Obviously, as a professional group of teachers, teacher educators and supervisors, we have a long way to go. We need to revise our teacher education program to help teachers handle an individualized instructional program; we must continue to develop instructional materials which are specifically adapted to meeting needs for instruction in very specific areas and with specific objectives in mind; we need to sharpen up our own concepts and understandings of what students need for entry occupations so we can help students make application of principles to specific occupations -- not merely memorize the principles.

We do not have time to discuss the implications here, but as a professional group of teachers, supervisors and teacher educators we must decide what kinds of materials can appropriately be produced in regional centers and what materials must be prepared for use within individual states.

Regardless of the problems and the magnitude of the task, I am optimistic about the future. The provisions of the Vocational Education Amendments of 1968, Report 1938, provide a basis for optimism. These amendments include an authorization for appropriation of sizable sums "to promote the development and dissemination of vocational education curriculum materials---."

This kind of support by the Congress, together with the enthusiasm of educators in vocational agriculture gives me confidence in the ability of our group to provide more adequate and much improved programs of vocational agriculture in the future.

To summarize briefly---(1) The expansion of the vocational agricultural program has caused us to include students with a wide range of occupational objectives in each class. (2) To help students prepare for and meet their occupational objectives in vocational agriculture educators need to develop individualized instructional programs. (3) The staff in vocational agricultural education including State Office personnel, teacher educators and teachers in Michigan is working on manuals and "packages" of instructional materials

to help teachers individualize instruction in vocational agriculture. (4) Education in Vocational agriculture has a high and challenging future with many opportunities for the development of improved programs to meet the needs of students.

TEACHER COMPETENCY FOR SUPERVISING NEW STUDENT OCCUPATIONAL EXPERIENCE PROGRAMS

Ralph J. Woodin, Professor, Agricultural Education
The Ohio State University

Occupational experience was never more important in agricultural education. Our students are seeking a wider variety of employment in agriculture and entering more challenging careers in farming and ranching. Their problems in entering an agricultural occupation stem largely from these difficulties, most of which can be met through well planned individual programs of occupational experience. These are their shortcomings as high school graduates:

1. Lack of ability and skill
2. Limited experience in decision making
3. Uncertain career choices
4. Physical and mental immaturity
5. Lack of reputation as workers and producers
6. Inappropriate plans for further education
7. Lack of capital

The teacher needs to see himself as a guide to each of his students as they plan and develop individual occupational experience programs in agriculture. Teachers must help students understand their shortcomings as future employees or as beginners in farming and to select a sound program of occupational experience. Four different possibilities are generally available, including the traditional farming programs, the operation of a farm on a share basis, cooperative placement in farming or in off-farm agricultural occupations and experience secured on the school site, shop, greenhouse, school farm, and land laboratory.

As the teacher looks at his responsibility of supervising occupational experience, he needs to think in terms of:

1. Guiding each student to <u>select</u> the best possible program of occupational experience
2. Assisting each student in <u>planning</u> how he will carry out his occupational ex-
2. perience before it begins.
3. Helping the student as he <u>carries out</u> his plans for his experience.
4. Helping the student to <u>evaluate</u> and <u>replan</u> his occupational experience.

Each of the types of teachers listed below requires a different type of preparation for supervising his student's occupational experience programs.

* The technically prepared teacher needs:

1. An orientation workshop of approvimately 3 weeks duration providing graduate credit with a generous section on supervision of occupational experience
2. Special supervision and visitation. Individual help will probably be needed by this teacher in order for him to understand the opportunities and procedures which he has in supervising occupational experience.
3. Publications for teacher and student use.
4. A planned sequence of professional courses in agricultural education including one on supervising occupational experience.

* The undergraduate in agricultural education needs:

1. Summer work experience should be broadened to include experience in off-farm occupations.
2. Study of all types of occupational experience prior to student teaching. Students should be acquainted with farming programs, with cooperative training programs and with school provided occupational experience
3. Student teaching which includes supervision of a variety of student occupational experience programs
4. Special supervision and follow up of the new teacher during his first year teaching.

* The experienced teacher of production agriculture who is undertaking new agricultural program or who is broadening and updating his students occupational experience needs:

1. An orientation workshop similar to those listed above.
2. Special supervision and visitation.
3. Publications for teacher and student use.
4. Work experience in an off-farm agricultural occupation or in some cases, in modern farming and ranching.

This last approach is particularly important because many teachers' work experience was secured years ago and needs to be updated.

The following are guidelines for developing student programs which should be helpful to all teachers.

A presentation to the Agricultural Education Division of the American Vocational Association.

Dallas, Texas 12/13/68

GUIDLINES FOR DEVELOPING STUDENT PROGRAMS
OF OCCUPATIONAL EXPERIENCE IN AGRICULTURE

The occupational experience program should:

Provide the experience necessary for the development of abilities important to the student's success in an agricultural occupation.

Be planned cooperatively with the student, his parents, and his employers under the guidance of the teacher.

Be planned soon after the student is enrolled.

Be commensurate with the interests, and capabilities of the student as well as his resources in terms of labor and capital.

Be continued and expanded, so as to increase size, scope, and managerial responsibilities during the high school years.

Include a financial arrangement providing an equitable division of the costs and returns, salaries and wages for the parties involved.

Provide opportunity for a financial return to the student each year.

Provide experience in money management including budgeting, recordkeeping, saving, risk bearing, financing, marketing, and the use of credit.

Provide opportunities for experience in decision making as well as managerial skills.

Improve the facilities for family living, making the home a more comfortable and attractive place in which to live.

Cover a period of several years rather than be planned for one year at a time.

R.J.W.
11/15/68

ADULT EDUCATION FOR PERSONS EMPLOYED IN OFF-FARM AGRICULTURAL OCCUPATIONS *

David R. McClay
Head, Department of Agricultural Education
The Pennsylvania State University

Agricultural education courses for adults in farming have been taught by vocational agriculture teachers for nearly half a century. However, courses for adults employed in agricultural occupations other than farming ~~is~~ are new. The four courses described below have been or currently are being offered for adults in Pennsylvania. They are examples of the agricultural courses for adults emerging over the nation taught by agricultural teachers.

COURSE - Adult Education in Agricultural Supplies (Ag Business)

Fred D. Dillner, Agriculture Teacher
Shippensburg High School, Shippensburg, Pa. 17257

Enrollees: Adults, 23 to 55 years of age, including store managers, department managers, field representatives, salesmen, and key workers in feed, seed, fertilizer, agricultural chemicals, and farm and industrial machinery businesses.

Course length: Six two-hour weekly sessions

Course content: "Human Factors in Management"

1. What are the functions involved in managing an agricultural supplies business?
2. What is a successful business? What factors contribute most to its success?
3. What factors most frequently cause business failure?
4. How can problems encountered in an agricultural supplies business be identified and simplified?
5. What human factors are most important in managing and operating an agricultural supplies business?

* Presented to the Agricultural Education Division, AVA Convention, Dallas, Texas, December 13, 1968.

Worksheets consisting of management evaluations and sample problems involving decision making were used as part of the teaching procedure. Discussion was developed from the worksheets and time was provided the learner to ask questions and develop his own thought patterns. The program materials attempted to define, develop, and improve the attitudes, values, and skills necessary in managing oneself, other personnel, and the trade or business. The course emphasized that the most important part of the word management is "man" -- man's ability to cope successfully with the many decisions or adjustments that must be made in today's business activities.

Courses given and planned for adults in agri-business:

1967-68, Dairy Cattle Nutrition
1968-69, Credit Management

COURSE - Nursery and Landscape Practices for Horticulture Employees

Ben Horowitz, Agriculture (Horticulture) Teacher
Lower Bucks County Vo-Tech School
Fairless Hills, Pa. 19030

Enrollees: Employees of ornamental nursery and landscape businesses

Course length: Ten two and one-half hour weekly sessions

Course content:

1. Lawn Management
2. Growing Desirable Shrubs
3. Growing Desirable Trees
4. Pruning Trees and Shrubs
5. Propagating Nursery Stock by Seeds
6. Propagating from Cuttings
7. Humidification and Mist Systems
8. Layering and Division
9. Propagating Procedures for Azaleas
10. Propagating Rhododendrons from Cuttings
11. Controlling Insects and Diseases
12. Fertilizing Trees and Shrubs

Other courses given or planned:

1. Seminar in Small Business Management for Ornamental Nursery and Landscape Business employees. (Given in cooperation with Small Business Administration, Philadelphia, during the Fall, 1968).

   Course consisted of ten two-hour sessions.

2. Commercial Flower and Plant Production (to be given during the Winter of 1969).

COURSE - Turfgrass Maintenance

Kenneth B. Rhodes, Agriculture (Horticulture) Teacher
Eastern Montgomery County Vo-Tech School
Willow Grove, Pa. 19090

Enrollees: Salesmen, landscapers, groundskeepers, and golf course employees

Course length: Fifteen two-hour sessions

Course content:

1. Identification of the Grasses
2. Effects of Height of Cut and Mowing Stress on Turfgrass
3. Preventing and Correcting Thatch Build-up
4. Recognizing, Preventing, and/or Correcting Compaction on Lawn Areas
5. Irrigation of Lawn Areas
6. How Fertilizer Rate, Grade, and Analysis Affect the Turfgrass
7. Identifying and Controlling Weeds
8. Insect Control
9. Recognizing and Controlling Turfgrass Diseases
10. Use of Special Equipment Designed to Maintain Lawn Areas
11. Diagnosing Law Problems

Other courses underway or planned:

Fall, 1968 - Developing and Maintaining the Landscape with Nursery Stock

Fall, 1968 - Floral Design (for employees of the floral industry)

Winter, 1969 - Power Mechanics (Ornamental Horticulture)

Turfgrass Technology

Winter, 1969 - Ten weeks of instruction (full-time) at the school

Spring and Summer, 1969 - Supervised occupational experience on-the-job

Fall, 1969 - Ten weeks of instruction (full-time) at the school

COURSE - Laboratory Animal Technicians

S. S. McDonough, Agriculture Teacher
Walter Biddle Saul High School of Agriculture
7100 Henry Avenue
Philadelphia, Pa. 19128

NOTE: Course was conducted in cooperation with the American Association for Laboratory Animal Science

Enrollees: Animal technicians (employees of drug companies, hospitals, laboratory animal breeders) who:

a. had at least three years experience with laboratory animals
b. had earned certification by AALAS as junior animal technicians
c. had an interest in preparing for the National Senior Animal Technician Examination offered by AALAS

Course length: Fourteen two-hour sessions

Course content:

1. Role of the Laboratory Animal Technician
2. Life, Living Matter and Biological Organization
3. Structure and Function
4. Genetics and Mating Systems
5. Summary of Breeding Data for Laboratory Animals
6. Nutrition and Metabolism
7. Handling
8. Animal Health and Disease
9. Sanitation
10. Animal Facilities Design
11. Bedding Materials
12. Administration, Management, and Record keeping
13. Shipping and Receiving
14. Safety (general)
15. Safety (radiobiological)
16. Animal Experimentation
17. Examination

NOTE: The school offers the following courses or "options" for their high school students:

a. Animal Technicians
b. Agricultural Business
c. Agricultural Machinery Sales - Service
d. Agricultural Production
e. Horticulture
f. Turf Technology
g. Agricultural Sciences
h. Meat Cutting

STATEWIDE INTER-RELATED PROGRAMS IN VOCATIONAL EDUCATION[1]

The Vocational Education Act of 1963 and its amendments of 1968 make it mandatory that all recognized disciplines in Vocational Education work together in establishing inter-related programs to meet the needs of all students, as well as the manpower needs of tomorrow's industries. In doing this, it is necessary to consider the inter-mingling of commonalities in all sectors of our economy.

In the short time that's given me today, instead of citing examples of innovative programs at the local program level, I am going to present some ideas on an organizational structure at the state and regional levels which will bring about innovative activities at the local level to inter-relate vocational programs. It has been the thoughts of some vocational educators that we must eliminate the vertical approach to operation of programs such as Agriculture, Home Economics, T & I, etc., and go toward a complete horizontal approach. This idea is to organize the state staffs to administer programs by levels of education such as special needs, secondary, post-secondary, adults, etc., and treat occupational areas at these levels in an across-the-board program planning, development, supervision, and implementation. It is my opinion that we can maintain the identity and integrity of individual section disciplines, while at the same time establish a process for horizontal planning at the state and local levels. I'd like to illustrate this by showing you what we in Florida want to establish in the years ahead as our organizational pattern for state staffing.

---

[1]Presented by C. M. Lawrence, Director, Agricultural Education, State Department of Education, Tallahassee, Florida, at the AVA Convention, on December 13, 1968, at the Agricultural Education Division General Session, Baker Hotel, Dallas, Texas.

Let us take a look at the organizational structure of the Agricultural Education Section first and then tie it in with the organizational structure of the total Vocational, Technical, and Adult Division. You will note that the total function of the Agricultural Education Section is to provide planning, development, supervision, and implementation of all educational programs in Agriculture. This will give us a procedure for vertical operation of agricultural programs so that we can maintain articulations among all levels of instruction.

The Agricultural Education Staff is then divided into three functional groups. One group being the Area Supervisors who are responsible for the supervision and implementation of all Agricultural Education programs in a geographical area. Later you will see how these staff members work horizontally with other division personnel. The second group is listed as program consultants for the various levels of instruction, such as special needs, secondary, post-secondary and adults. These staff members will have the responsibility of planning and developing programs, working both at the division and sectional level to plan for research and innovative approaches to program development. The third group in addition to being part of the total planning group for the section will serve as youth club operation consultants. We anticipate that this will include the FFA plus any post-high school agricultural leadership organizations which may be organized.

Now let us take a look at the division organizational structure and see how the vertical operation of Agricultural Education programs can fit into a horizontal approach for division-wide planning and

operation. You will note that the division is broken down into five primary areas: program operation, program planning and development, program supportive services, administrative services, and a fifth area, supervision and implementation at the regional level.

The various sections are placed in the program operation area. By maintaining the sectional structure, programs such as Agricultural Education can continue to operate at the state level. The horizontal operation is brought about by all program directors serving as a Coordinating Committee to determine policies for all programs.

In the program planning section of the division, special program consultants from each of the sections will work with a division program planning director for horizontal planning of all programs.

In order to provide adequate supervision of programs at the local level, our State has been divided into five regions and each of the Area Supervisors in Agriculture, Home Economics, T & I, etc., will serve under a regional director to coordinate activities of all programs. Please remember that these same area supervisors will be directly responsible to the Agricultural Education Program Director for administration of all agricultural programs.

Let me briefly summarize what I have tried to say. No longer can we continue to operate as an Agricultural Section or any other section for that matter, without fully cooperating with all other sections of Vocational, Technical and Adult Education. On the other hand, it seems foolish to me to abandon completely old approaches of section operations and set up a structure horizontally at the division level. It is feasible to so organize state staffs that

the identity and integrity of individual disciplines will be maintained and still provide horizontal planning among all sections. This type of structure will provide a climate for local personnel to develop inter-related programs in Vocational Education.

Figure 1. Educational Progression and Entry into Various Agricultural Occupations Through Different Programs of Instruction in Various Institutional Settings (Developed by C. M. Lawrence, Director, Agricultural Education, State Dept. of Education, Tallahassee, Florida 32304)

PROFESSIONAL PERSONNEL DEVELOPMENT IN AGRICULTURAL EDUCATION*

Because of a long-standing interest in staff development in the fullest meaning of the term, I am pleased to have a part on this program. As NVATA President Tom Devin knows, and partially upon his counsel, it was in vocational agriculture and in this state some fifteen years ago that my professional development was shaped which led to graduate study and to the various roles in teacher education and activities in the several national leadership development and staff development programs. For this reason, I am particularly gratified by the invitation to speak to the Agriculture Education Division of the AVA.

Time does not permit to reconstruct recent history wherein the need for leadership development has become most critical or to discuss theories of leadership or the nature of leadership. Of necessity, my comments will be of a very practical nature, outlining some of the current needs of the profession and suggesting development programs which are more broadly based than currently provided in most agricultural teacher education departments, or in a set of seminars or institutes currently supported by the Office of Education.

Let me place the challenges in perspective by reviewing a few statistics:

* 65,000 teachers of vocational education were employed in 1965. This number need in 1975 will be 350,000 as projected by the Office of Education. For each local supervisor or administrator in 1965, there will be two in 1975.

* There are over 10,000 teachers of vocational agriculture in the United States. We experience an annual turnover rate of approximately 12%.

* The number of vocational agriculture teachers needed in the United States by 1970 is estimated to be about 11,250.

* In 1967, 117 departments of vocational agriculture could not open because of a shortage of qualified teachers.

* Only 60% of those qualified for teaching vocational agriculture in the United States enter the profession.

* Our host state, the state of Texas, is the one requiring the largest number of teachers of vocational agriculture. A total of 1,140 vocational agriculture teachers were employed in 1967.

---

*

Symposium presentation by Clodus R. Smith, Associate Professor of Agricultural and Extension Education, Director of the Leadership Development Seminar for Vocational and Technical Education Personnel, and Director of the Summer School, University of Maryland, College Park, Maryland; to the Agricultural Education Division, American Vocational Association, Adolphus Hotel, Dallas, Texas, December 13, 1968.

* The most acute shortages of teachers of vocational agriculture as reported in 1967 were in Florida, Minnesota, Texas, North Carolina, and Michigan. All but ten states reported a shortage of teachers of vocational agriculture for that year.

* Enrollment in departments of agriculture education located in the central states dropped 28.9% from 1965 to 1967. During the same period of time agricultural colleges increased their enrollment 33.8%.

The recruitment of teachers of vocational agriculture must be shared by the people in this room -- the teachers, the supervisors, and the teacher educator understanding of the various roles and responsibilities and recognizing that concessions are likely to be made by each of the three groups if the demand for teachers of vocational agriculture is to be met. The failure to satisfy this need for personnel will result in the failure to meet the educational needs of rural youth, the closing of departments, and a reduction in the prestige for our professional field of service. We can meet these challenges. We can overcome these problems. It has been estimated by the AVA recruitment committee that the shortage of teachers of vocational agriculture would be met if each teacher would recruit one student every four years to prepare for a teaching career.

I should like to bring into focus the staff development needs in agriculture education as compared to other fields of services. Table I shows the actual and projected enrollments and percentages in vocational and technical education by type of training program. Although it has been of great concern to agriculture educators that vocational agriculture does not maintain a pro-rata of the enrollment over the projected time period, it is interesting to note that in terms of enrollments, vocational agriculture appears to be a healthy program with a future showing an acceptable growth pattern. This material was developed in 1965 at which time it was projected that enrollment in vocational agriculture courses in 1975 would almost double the enrollment in 1960. Experience since 1965 would indicate that the 1975 projection is probably conservative.

Although not shown by type of program, Table II does reveal the actual and projected enrollments and percentages over the same time period by purpose or level of program. We observe that program growth is projected for post-secondary programs and in programs identified for persons having special needs.

Staff development responsibilities are not confined to the pre-service or in-service training of teachers. Staff development includes the professional preparation of personnel for local administrators for positions in state departments of education and for professional personnel in regional and national offices employed by the Federal Government. Table III indicates the actual and projected number of teachers and federal, state, and local professional personnel. The one concept I would like to leave with you from this table is that although we have experienced a "vacuum" in the number of persons preparing for professional careers in vocational and technical education in general, and in vocational agriculture in particular, we will need twice as many persons to fill responsible positions if we are to have an effective and efficient system of vocational and technical education in 1975. The challenge to teacher educators, and to all of us, is a very real one. Only by satisfying this need may we have a viable program of vocational and technical education in American public schools.

Although the situation appears blique, there are hopeful signs and some new approaches and strategies that show promise. The AVA Program of Work and AVA Teacher Education Council, the National Deans Conference held at the University of Nebraska, and the 1968 amendments which include vocational and technical education as a part of EPDA activities will be discussed.

1. The AVA should be congratulated for its recognition of staff development problems which confront the profession. It has developed, as a part of its Program of Work, a plan designed to develop and strengthen professional personnel in vocational and technical education.

I commend to your reading that section of the AVA Program of Work which appears in the February, 1968, issue of the American Vocational Journal under the guidance of Robert Worthington, Assistant State Superintendent of Public Instruction for New Jersey, the Teacher Education Council has become an effective unit. It has developed a brochure, recruitment guidelines, and planned two sessions which have been presented at this convention, and has developed plans which should lead to a strengthened program involving state teacher education coordinating councils.

The Agriculture Education Division of the AVA is an outstanding example of shared leadership for the solution of staff development problems at the national level. The structure that makes this leadership possible involves teachers, supervisors, and teacher educators. It will take all three to solve some of the problems which confront the profession by providing new teachers which may become involved in staff development programs to become supervisors, teacher educators, research personnel, specialists, and local personnel needed to develop and staff the comprehensive programs required in today's agriculture education program.

2. The National Conference of College Deans may find its place in the annals of major activities which will have charted the course of vocational and technical development programs. Planned and conducted by agricultural educators, Jim Horner and Roy Dillion at the University of Nebraska, the implication of recommendations of the several task force groups have relevance to all facets of vocational and technical education. It was encouraging to the leadership of the conference that a disproportionate number of leaders, consultants, and participants represented colleges of agriculture and agricultural education.

I should like to mention some of the recommendations:

a. There is a common core of knowledge in vocational and technical education that should be a part of the education of all teachers. Organizational and operational strategies which aid in the inclusion of such a component in the education of all teachers should be sought.

b. Consideration should be given to the placing of basic concepts of vocational and technical education in common elements such as courses, units of instruction, and other training activities.

c. State councils of teacher educators in vocational-technical education should be established to articulate and coordinate program development across the vocational fields. Such state councils should involve the total program of vocational and technical teacher education and should work toward the improvement, expansion and coordination of efforts among all vocational and technical teacher educators within a given state.

d. A master plan for vocational-technical teacher education should be developed for each state by a broadly representative commission or group with long range projections for the future development and financing of these programs. This master plan should include projected teacher education enrollment, programs, and institutional responsibilities for specific vocational-technical areas. A systematic method for anticipating professional staff needs should be balanced by plans for optimal utilization of available resources.

e. The strategy for professional staff development and the organizational patterns within institutions may be best served when all fields of service within vocational and technical education are coordinated through a single unit. Such a unit may be a school, division of a college, or a large, comprehensive department administered by a dean, assistant dean for vocational and technical, or a department head.

You will want a copy of the report of this highly successful and significant Conference.

3. Recent legislation amended the Education Professions Development Act to provide for leadership development and the strengthening of vocational teachers and other personnel. Twenty-five million dollars were authorized for Fiscal Year 1969, and thirty-five million dollars for FY 1970.

This action should permit the fulfillment of the recommendations of the 1968 National Outlook Conference in Agriculture Education and satisfy some of the wishes of the profession by providing institutes, fellowships, and the implementation of comprehensive, coordinate staff development programs for supervisors, teacher educators, and specialists as well as the in-service training of teachers.

To implement action and to assist the development of guidelines for receiving and considering EPDA proposals, Mr. Robert Worthington, Assistant Superintendent in New Jersey, is chairing an advisory group for the Bureau of Educational Personnel Development. Additional information will soon be available on this new and valuable staff development resource.

A Suggested Leadership Development Program

We must accept the responsibility for identifying potential leaders to provide quality occupational training at the secondary, post-secondary, and adult levels. I should like to suggest six phases in a leadership development program in which you may become involved. Here we are not speaking of leadership development seminars, but something much more comprehensive. The first three of these are routine procedures in such a program, while the final phases relate to more subtle aspects of the program.

1. An inventory of possible leaders based on personal contact.

It is essential that persons responsible for staffing or manning an organization have wide contact with possible leaders both within and outside the organization. These contacts must be more than casual or superficial in nature and must be sufficiently intimate to facilitate judgment for the kind of contribution these persons could make to the organization.

2. An audit of all tasks within the organization for which leadership is required.

This is, in essence, utilization of the vocational concept of job analysis. The audit should be a discriminating list which indicates the specific requirements of each leadership skill to be developed. This "situation theory" of leadership is useful at this point where it places emphasis upon the various aspects of the situation--the task, the group, the culture which is essential in placing and assigning leaders. This audit of leadership positions will identify specifics for each position where special characteristics of leadership, such as imagination, consideration, and initiative, are required.

3. Planned strategy for placing and developing leaders.

The essence of this step is to mesh the first two steps. Good strategy here calls for the initiation of a program that recruits persons with ability or potential ability to prepare them for leadership roles in the situations in which leadership is now required or likely to be required.

What has been suggested as the first three steps are mechanics of the program. They are simple, uncomplicated in nature and widely known. The next three steps stress the importance of the intricate task of helping leaders develop.

4. Develop a framework for appraising groups, tasks, and leaders.

This is an essential and critical requirement for staff development programs. The qualitative aspects must not be overlooked. We must pay close attention to what we expect of our potential leaders -- that is what the leader must be and what the leader must do.

5. The development of a program of supervision.

There is a definite need of an appropriate organization within which developing leaders can continue to be supervised and developed within the field of vocational education. Through such an arrangement, recognized educators should spend some time with developing leaders to release the capacity for new skills, new insights and new abilities. A skilled and supportive adviser, through regularly arranged leadership development meetings, holds perhaps the greatest promise to provide the most fruitful means of leadership development at this level. The

degree of formality of this arrangement and activity may well depend upon the personality of the supervisor and the psychological atmosphere of the organization. Regardless of these qualities, the need for such activity is not lessened.

6. The development of leadership courses, seminars and institutes.

There are several important dimensions which should be a part of leadership courses, seminars, and institutes. These are: (a) actual knowledge including organizational functions and procedures and resources available in the organization; (b) understanding of people, their needs and relationships, the characteristics of group life and the requirements of leadership in the various types of group settings; and (c) developing and using leadership skills.

Summary

In summary, it seems certain that a society which supports education as one of its tools of self-preservation and self-improvement will not long be patient with that sector which is no longer able to fulfill its role in society. It is clear that educational leaders are faced with challenges which will not diminish and which cannot be ignored or taken lightly.

The importance of selecting men of potential ability, of giving them responsibility, consistent support, opportunity of sharing their problems with their peers, and the friendship and counsel of an experienced leader may indeed be the key to the success of a leadership development program.

The need is great for a quantity of high quality leaders. So are the opportunities for interested educators. But with the expanded opportunities must come assurance that the quality of leadership is commensurate with the increased responsibility of the individual and expanded goals of education.

PRIORITY GOALS	SUGGESTED WAYS TO ACCOMPLISH GOALS	
	AVA	AFFILIATED STATE ASSOCIATIONS
Developing and Strengthening Professional Personnel		
1. Coordination of teacher education—each state should develop a plan for coordinating teacher education in vocational, technical, and practical arts education on a continuing basis.	a. AVA Council on Teacher Education assume a communicating and coordinating role for state councils, including a program at the annual AVA Convention.	a. Form a state council for better communication and coordination of teacher education in all areas of vocational, technical, and practical arts education. b. The state council should coordinate efforts with state association and AVA Council on Teacher Education. c. The state council should communicate with state and local leaders in administration and supervision of vocational, technical, and practical arts education.
2. Recruitment of teachers—all people now in vocational, technical, and practical arts education should become active in recruiting teachers and prospective teachers.	a. Encourage research and pilot programs in new approaches to qualify teachers. b. Encourage publication of information about current practices in qualifying and using assistant teachers, special teachers, teacher aides, and other means of extending the services of fully qualified vocational teachers. c. Support legislation to fund programs of training and support for teachers, teacher educators, supervisors, and administrators.	a. Establish a continuing committee on recruitment with representatives from all divisions and areas of interest. b. Each division establish a continuing committee on recruitment with representatives from teachers, supervisors, and teacher educators. c. Program goals should be established by recruitment committees and made a part of the state program of work. d. Study certification requirements, admission to teacher education, and other policies relative to preparation for vocational teachers. Make recommendations of needed changes to state board and other policy-making groups. e. Develop a student trainee program for prospective vocational teachers (patterned after civil service) and present to state boards.
3. Orientation to vocational education for all school personnel to give them knowledge and understanding of the process for preparing individuals for the world of work.	a. Transmit resolution entitled "Orientation to Vocational Education for School Personnel" and other information to colleges of education and state departments of education to support need for all school personnel to understand the world of work. b. AVA divisions should be encouraged to develop proposals for providing opportunities for all school personnel to become acquainted with their programs for the world of work.	a. Work with other state education associations to develop a statement on orientation of all school personnel to the world of work. b. Encourage state councils on vocational teacher education to develop a statement on orientation of school personnel to vocational education to be transmitted to institutions engaged in the preparation of teachers. Proposals might be developed for inservice education programs for teachers on the job. c. Each division is urged to develop proposals for local teachers and coordinators to acquaint all teachers with vocational programs.

OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

My topic concerns a research project carried out by the Department of Vocational Education of The Pennsylvania State University, pursuant to a contract with the Office of Education, United States Department of Health, Education, and Welfare. This project, entitled Effects of Field and Job Oriented Technical Retraining on Manpower Utilization of the Unemployed, was initiated early in 1964 and was completed in September of this year. The two specially designed training programs which were the subject of this research were operated under provisions of the Manpower Development and Training Act. Dr. David C. Bjorkquist, now at the University of Missouri, was project director.

As indicated by its title, the project was designed to determine what effects, if any, field and job oriented technical retraining would have on a selected sample of unemployed Pennsylvanians. Briefly, the two training programs had the following characteristics:

The job-oriented program prepared men for positions as tool design technicians, while the field-oriented program preparation was for machine and tool designers in mechanical technology. The emphasis on the job-oriented training was depth in tool design preparation. Courses were selected which would contribute to the preparation of a tool design technician. The objective was to produce a person who could immediately, after the completion of training, contribute to the cause of his employer as a tool designer. This course was taught in a vocational-technical school and was, in many ways, similar to grades thirteen and fourteen in technical programs. School personnel, together with a local industrial advisory committee, prepared the curriculum.

The field-oriented training program emphasized breadth in mechanical technology with preparation pointed toward making the individual flexible in this field and ready to accept future opportunities for advancement and change. It was recognized that the product of this program may well need additional training after securing a job, but it was held that a wider variety of opportunities for employment would be open to him. This course was taught on a Commonwealth Campus of The Pennsylvania State University. This program bore some resemblance to an associate degree program or an evening school extension program. The curriculum was prepared by the College of Engineering in consultation with practicing engineers.

The samples of unemployed persons were selected and initially screened by the Pennsylvania State Employment Service.

This screening was done according to these criteria. Only persons eligible for MDTA training were considered. This meant that, among other things, each applicant must have been unemployed or underemployed and he must have spent at least three years in the labor force. All applicants were graduated from high school or had a high school equivalency. Some familiarity with mechanics or machine operation and an expressed desire to become retrained as a technician were also required. The General Aptitude Test Battery was used to measure aptitudes. The three pertinent measures which were used for selection were General, Numerical and Spatial abilities. An interview was used to confirm the aspiration of each of the applicants.

On the basis of aptitudes, interview evaluation, work history and previous education, a pool of qualified applicants for the two training programs was formed. From this pool persons were assigned to programs

on the basis of their preference for training location. With the exception of perhaps half-a-dozen cases, students were assigned according to their first choice. There tended to be geographic factor working in assigning students, inasmuch as most of them chose the training facility closest to home. Students were not randomly placed. Thirty-five trainees were assigned to the job-oriented program and 40 were assigned to the field-oriented program. There were 109 original applicants.

In most respects we were unable to measure differences between the two groups. There was no significant difference in the General Aptitude Test Battery scores. With a mean of 100 and standard deviation of twenty on the GATB, both groups were near one standard deviation above the mean on all three measures.

Approximately one-third of the students in each of the programs had completed some education beyond high school. The mean number of years of formal education were 12.4 and 12.2 years. The age of the students was about 23-1/2 years at the beginning of training. About one-third were teenagers, 18 or 19 years old. The oldest man in the job-oriented program was 43 and the oldest in the field-oriented program was 47. Since these were retraining programs, we had expected that the mean age of the group would be somewhat higher, perhaps about thirty. But since we are currently in a period of high employment, there do not seem to be as many older men who are available for retraining. About one-third of the men were married and many of them had graduated from high school in the spring of 1964.

Initial Placement

One factor commonly associated with training success is the successful placement of graduates. Of the twenty-five students who graduated

from the field-oriented program, nineteen (or 76 percent) had accepted jobs which, by job title, seemed to be related to their training. Three students (12 percent) entered the military service and one student (4 percent) enrolled in a four-year college program. Two students (8 percent) had not accepted employment as of the completion of the training. Of the 32 job-oriented graduates, 24 or (75 percent) had accepted jobs related to their training, one (3 percent) entered the military service and seven (22 percent) had not accepted jobs as of the completion of training. There were many positions open to the graduates, however, some chose to remain in their "home town" area where jobs were not plentiful. This was particularly true of those graduates who were from the coal belt region of the State. Consequently, some of those who graduated accepted compromise positions or remained unemployed.

Although many graduates reported to work immediately after training, it required an average of almost four weeks for them to begin their first job. The job-oriented graduates averaged 3.93 weeks while the field-oriented graduates averaged 3.76 weeks before becoming employed. The time required by industry for the screening and selection of individuals hired for technical positions was reflected by this four week figure. Time lapse from initial job application to beginning work often was two or more weeks. Many employers were hiring for the "long haul" and wanted to be assured that the right man was selected; i.e., it might take from three to six years for an individual to become a full fledged designer.

Of the 27 job-oriented graduates employed in industry, eight changed their place of residence to secure their first job. Percentage-wise, more than twice as many in industry from the field-oriented program changed their place of residence after completion than those from the job-oriented

course. There was a significant difference (p .01) in the mean number of weeks (.81 weeks for those who moved) than was required for those who didn't (5.53 weeks).

An analysis of variance was used to determine whether there was a difference in the mean age of those who moved and those who did not. Also the difference in the mean age of graduates of the two programs employed was tested.

The mean age of the 21 graduates of both programs who moved to secure their first job was 22.23 years and the mean age of 26 graduates who did not move to secure their first job was 25.81 years. This difference in ages was significantly different. The mean ages of graduates of the two programs was not significantly different. Married graduates did not move more or less to secure their first job than did the single graduates.

Additional interviews with the graduates were conducted one and two years after graduation. Of the 28 job-oriented graduates employed in industry, 12 made a total of thirteen moves during the first year after graduation. During the second year, three job-oriented graduates made one move each.

Thirteen of 20 field-oriented graduates in industry moved a total of 20 times during the first year after graduation. During the second year, one move was made by each of four field-oriented graduates.

During the first year following graduation there were 16 job-oriented and nine field-oriented graduates who experienced some unemployment. A total of 28 design graduates from the job-oriented program employed in industry had a mean of 3.75 weeks of unemployment during the first year. Twenty field-oriented graduates employed in industry averaged 3.63 weeks of unemployment during the first year. One job oriented graduate was

unemployed for 26 weeks, while the longest unemployment for a field-oriented graduate was 21 weeks.

Two job-oriented graduates were unemployed an average of two weeks each during the second year after graduation. During this same period, four field-oriented graduates were unemployed an average of 5.50 weeks each. The longest period of unemployment for any individual during the second year was nine weeks.

To determine the relative salary position of the graduates in relation to their job peers, comparisons were made between the average salary of Class B Draftsmen in each metropolitan area in which there were three or more graduates from one of the two training programs. At the end of the first year, the job-oriented graduates were earning eleven to twenty-two dollars less per week than Class B Draftsmen in the area. The field-oriented graduates were earning about twenty-five dollars more than Class B Draftsman in two metropolitan areas, and fifty dollars less per week in a third metropolitan area during the first year. A year later, the job-oriented graduates had salary increases of fifteen to twenty dollars more per week, but were still earning somewhat less than Class B Draftsmen in the area. The field-oriented graduates were earning about eight to ten dollars more per week during the second year.

Employer Ratings

After graduates had been on the job for one year and again after two years on the job they were rated by their supervisiors on four aspects of their job performance.

More than 50 percent (52 percent-77 percent) of the graduates of both programs were rated above average or outstanding during each rating on "manipulative work," "personal and social qualities," and "work

qualities and habits." In "occupational technology," graduates of both programs tended to be rated average or above average. Smaller percentages (3 percent-12 percent) were rated below average or unsatisfactory.

With the exception of ratings for the field-oriented group on "manipulative work," there were larger percentages of graduates rated above average or outstanding after two years on the job than there were a year previous. These shifts were accompanied by decreasing percentages of average ratings.

During the first interview contact a job analysis was used to gather data about skills used on the job, work aids used, work field, and to describe job functions. The analysis technique used was one structured by the United States Bureau of Employment Security and used in their preparation of the 1965 Edition of the Dictionary of Occupational Titles (Dictionary, 1965).

Each interview required about 45 minutes, of which, approximately 30 minutes were spent for the job analysis. By observing the output of the worker and asking questions about what he did, how and why he did it, and what skill was involved the job analyst prepared a job description. A sentence analysis of each job description was prepared to identify the worker's function, relative to data, people, and things. In general a hierarchy has been established in each of these three areas in which a lower code number identifies a higher level of involvement required by the job. Thus a job of compiling data requires a higher level of involvement by the worker than does a job of computing. The code numbers derived by use of the hierarchy constitute degits 4, 5, and 6 of the six digit DOT code number.

The most difficult judgments concerned the worker's level of involvement with data. Operationally, the worker's responsibility in making decisions was used to determine his data involvement. For example, a worker who manipulated data and then referred to a company reference manual for a prescribed action was considered to be "computing" data. If his job required that he collects and summarizes data, report these data, and carry out an action based on this, he was considered to be "compiling" data.

Although none of the jobs analyzed required the worker to perform in isolation, seldom was a specialized skill in dealing with people necessary to the performance of the job. In a few instances workers were required to direct the activities of others at the "speaking-signaling" level.

All jobs requiring the use of drafting instruments were considered to be at the "precision working" level with things.

Of 27 job-oriented graduates employed in industry, 25 were employed in the area of drafting and engineering. Two others were employed as inspectors. Sixteen of those employed in drafting and engineering held jobs which required them to compile data. Only two individuals had jobs requiring a significant involvement with people at the speaking-signaling level. Precision working with things was involved in the jobs of 24 of the 25 graduates employed in drafting and engineering jobs. The jobs performed by 14 job-oriented graduates in drafting and engineering required a level 3 (compiling) involvement with data, a level 8 (no significant relationship) involvement with people, and a level 1 (precision working) involvement with things.

Eleven of 20 field-oriented graduates working in industry were

employed in drafting and engineering. Other graduates were employed in three other work fields - machining, researching, and investigating. Nine of those employed in drafting and engineering compiled data. One of the eleven in drafting and engineering held a job requiring speaking-signaling with people. All others were not required by their jobs to be significantly involved with people. Precision working with things was required in all the jobs.

One and two years after training. Twenty-four job-oriented and 15 field-oriented graduates were employed in the work fields of drafting and engineering. These were jobs in which the individuals had varying responsibilities designing and drafting. Those graduates in the work field of researching were involved primarily in data collection in engineering experimentation. The individuals in the work field of appraising were working as inspectors. The individual in administering was responsible for negotiating contract changes. One individual was a materials handler in the field of loading-moving. Three graduates operated machines in the field of machining.

The jobs of all 24 job-oriented graduates employed in drafting and engineering one year after training required computing or compiling of data, speaking-signaling or no significant relationship with people, and precision working with things.[1] One year later, the level of involvement with data had increased for six individuals and decreased for one. Five individuals held jobs requiring the analyzing of data. Between one and two years after training the level of involvement with people had increased for five job-oriented graduates. Two individuals were responsible for persuading people and five others had speaking-signaling responsibilities. All job-oriented graduates in drafting and engineering

continued precision working with things two years after training.

There were 15 field-oriented graduates employed in the work fields of drafting and engineering one and two years after training. After one year on the job, three graduates were analyzing data, eleven were compiling data, and one was copying data. After two years at work, the level of involvement with data had increased for two persons and had decreased for one. One year after the completion of training one graduate was persuading people, five had speaking-signaling responsibilities, and eight had no significant relationship with people. A year later the level of responsibility in dealing with people had increased for three field-orientated graduates. One year after the completion of training one graduate in the work field of drafting and engineering was responsible for handling things.

All other graduates, one and two years after training, were responsible for precision working with things. There was no significant difference in the number of graduates of the two programs in the levels with which they worked with data, people and things two years after the completion of training.

With the exception of one graduate, who was in the work field of loading-moving one year after the completion of training, all graduates used many of the work skills which were specifically taught in the training programs. This was evidenced by their job descriptions and by their use of drafting, designing, and mathematics.

Changes in the percentages of graduates using the various drafting skills which occurred between one year and two years after training were relatively small. The largest percentage of change was in the use of graphs by field-oriented graduates. Eleven percent used graphs one year after training and 50 percent used them a year later. In actual numbers

this percent increase equals six individuals. The drafting skills used by the largest percentages of graduates were freehand lettering, sketching, dimensioning, sections, scale drawing, and orthographic projection. Two years after graduation all of the industrially employed field-oriented and 93 percent of the job-oriented graduates were using some drafting. skill.

Most noticeable changes in the percentage of graduates using design skills one year and two years after training were increases in the designing of tools for both groups, and fixtures, jigs, dies, and layout for field-oriented graduates. The percentage of individuals using no design skills was reduced during that period of time for both groups.

Among mathematics skills, arithmetic was used by all graduates, except one, a year after training. More specialized forms of mathematics - right triangle trigonometry, algebra, and plane geometry - were used by large percentages of graduates. None of the industrially employed graduates used calculus and less than one-half used solid geometry. It was interesting to note that at the end of year one, fewer job-oriented graduates reported using algebra than reported using right triangle trigonometry. A mathematician might argue that this was an impossibility, however, it seems probable that algebra was interpreted as algebra per se by those answering the inquiry about its use.

SUMMARY

In summary we feel that the project served to demonstrate several important aspects of technical training and employment: (1.) It is possible to reduce what is essentially a two-year technical curriculum to intensive one-year programs; (2.) Students will successfully adjust to

the intensive work-load of such programs; (3.) Graduates of such programs can compete successfully for job opportunities in industries.

Very few significant differences could be detected between the two groups of graduates. This we have concluded, is the result of the demand by industry for technically trained individuals. Employers acceptance and evaluation of the graduates was generally very favorable and several companies inquired as to the possibility of further training programs of this type.

The graduates themselves were well satisfied with their training and subsequent employment. Several of the Graduates continued their studies at the collegiate level. Graduates were making much more money than they were before training and living standards had moved upward.

INDUSTRY, EDUCATION AND GOVERNMENT
COOPERATE

I WISH TO EXPRESS APPRECIATION TO THE PANEL SPEAKERS AND TO THIS AUDIENCE FOR ALLOWING ME THIS OPPORTUNITY TO SUBSTITUTE FOR MY GOOD FRIEND AND FELLOW TRADE AND INDUSTRIAL EDUCATION ASSOCIATE ERNIE STUDEBAKER OF OUR WASHINGTON OFFICE WHO WAS UNABLE TO APPEAR TODAY WITH US. MR. STUDEBAKER EXTENDS HIS PERSONAL REGRETS TO ALL OF YOU AND THE ASSOCIATION AND WISHES EACH OF YOU A MOST PROFITABLE CONFERENCE.

I AM EXTREMELY PLEASED THAT I WAS ASKED TO SUBSTITUTE FOR MR. STUDEBAKER AND REPRESENT VOCATIONAL EDUCATION.

IT IS MY UNDERSTANDING THAT THIS STRENGTHENED RELATIONSHIP BETWEEN INDUSTRY, GOVERNMENT, AND EDUCATION, AS IT INVOLVES THE ELECTRONICS INDUSTRY, WAS ACTUALLY FORMALIZED BACK IN MARCH OF 1967 WHEN HENRY PAISTE, WHO WAS WITH PHILCO CORPORATION CALLED ON THE WASHINGTON OFFICE IN THE INTEREST OF THE ELECTRONICS INDUSTRY AND THE E.I.A. WE ARE VERY GRATEFUL THAT MR. PAISTE AND YOUR ASSOCIATION HAD THE EARLY FORESIGHT TO RECOGNIZE THE IMPORTANCE OF COORDINATION AND THE

SPIRIT OF TEAM WORK SO NECESSARY TO THE DEVELOPMENT OF THE PROGRAM.

AN IMMEDIATE FRIENDSHIP BETWEEN ORGANIZATIONS RESULTED FROM THIS EARLY MEETING AND OUR OFFICE CONTINUES TO BE EXTREMELY PROUD OF OUR CONTINUED WORKING RELATIONSHIPS WITH THE ELECTRONIC INDUSTRY ASSOCIATION. WE HAVE CALLED UPON YOU MANY TIMES AS A JOINT PARTNER AND YOU FOLKS HAVE ALWAYS RESPONDED IN AN EXEMPLARY MANNER WITH FULL KNOWLEDGE AND INTEREST IN THE GOVERNMENTS AND STATES RESPECTIVE ROLES IN THE INTEREST OF TRADE AND INDUSTRIAL EDUCATION AS WELL AS THE ELECTRONICS PROGRAMS SPECIFICALLY.

WE HAVE EXPERIENCED IN VOCATIONAL EDUCATION OVER THE YEARS MANY PERIODS OF STRENGTHS AND WEAKNESSES, MANY DROUGHTS AND MANY BOUNTIFUL HARVESTS. WE HAVE WITHSTOOD THE PRESSURES OF EDUCATIONAL GENERALISTS, OF MANY LOCAL SCHOOL ADMINISTRATORS WHO WOULD CHOOSE TO WATER DOWN VOCATIONAL EDUCATION AND FAVOR A SINGLE PREPARATORY PROGRAM FOR ALL STUDENTS AIMED AT STRICTLY THE FOUR YEAR BACCALAUREATE DEGREE. I HOPE YOU WILL FORGIVE ME IF I USE A PERSONAL EXAMPLE TO ILLUSTRATE MY POINT:

THIS EXPERIENCE CAME RATHER QUICKLY TO ME AS A NEWLY ASSIGNED STATE T & I SUPERVISOR IN THE SOUTH TEXAS AREA WHEN I EXPERIENCED MY FIRST TELEVISED SCHOOL BOARD MEETING WHERE I FELT BASIC VOCATIONAL EDUCATION PRINCIPLES WERE BEING CIRCUMVENTED BY BOARD DISCUSSIONS AFFECTING THE CONDUCT OF VOCATIONAL EDUCATION IN THE AREA. AND THIS IS WHERE I CALLED ON AND RECEIVED SOME SAGE ADVISE FROM A LOCAL VOCATIONAL REPRESENTATIVE I RESPECT MOST HIGHLY.

I WAS ADVISED THAT VOCATIONAL EDUCATION SINCE 1917 HAS BEEN MUCH LIKE THE PENDULUM ON A CLOCK, WITHIN THE TOTAL EDUCATION ENDEAVOR, AND THAT CYCLES MAY COME AND GO JUST AS THE PENDULUM ON A CLOCK SWINGS BACK AND FORTH, BUT WE SHOULD NOT SOUND THE ALARM TOO QUICKLY BECAUSE WE WILL HAVE OUR DAY UNDER THE SUN IN DUE PROCESS AND VOCATIONAL EDUCATION WOULD THEN CONTINUE TO TAKE ITS PROPER COURSE. IN THE MEANWHILE OUR JOB IS TO CONTINUE IN VOCATIONAL EDUCATION UTILIZING THE ESTABLISHED "CARDINAL PRINCIPLES" AS OUTLINED BY PROSSER TO THE BEST OF OUR ABILITY AND WATCH FOR THE TURN OF EVENTS THAT ARE INEVITABLE. I BELIEVE EACH OF US NOW HAS WITNESSED THIS TURN OF EVENTS.

WHAT DOES THIS ALL MEAN AND WHAT RELATIONSHIP DOES THIS DISCUSSION HAVE TO THE SUBJECT AT HAND OF COOPERATION BETWEEN GOVERNMENT, INDUSTRY AND EDUCATION AND I WOULD EXPLAIN AS FOLLOWS:

BASIC PHILOSOPHIES AND CONCEPTS OF SOUND VOCATIONAL EDUCATION ARE UNYIELDING. I WOULD USE AS AN EXAMPLE THE REQUIRED COORDINATION BETWEEN VOCATIONAL EDUCATION AND INDUSTRY IN UTILIZING TRADE ADVISORY COMMITTEES TO WRITE AND DIRECT AN ACCEPTABLE CURRICULUM THAT IS RELEVANT TO THE INDUSTRY SERVED AS WELL AS THE STUDENT SERVED. WE SOMETIMES ARE ACCUSED OF BEING OLD FASHIONED BY REQUIRING THE USE OF SUCCESSFUL TRADES PEOPLE FROM INDUSTRY AND INSTRUCTORS IN OUR T & I PROGRAMS REGARDLESS IF THEY ARE SECONDARY OR POST-SECONDARY TEACHERS, BUT THIS IS EASILY REFUTED BY ALL CONCERNED. OUR TEACHER TRAINING IS SPECIALIZED TOWARD THE SELECTION OF INDUSTRY QUALIFIED PERSONS. (EXPLAIN)

WE ALSO BELIEVE THAT THE TOOLS AND EQUIPMENT USED IN VOCATIONAL EDUCATION CLASSES SHOULD SIMULATE AS NEAR AS POSSIBLE THOSE THE STUDENTS WILL ENCOUNTER IN THE INDUSTRY SERVED, AND WE CONTINUE TO BELIEVE THAT NO POLICY DIRECTED TOWARD SUCCESSFUL VOCATIONAL EDUCATION SHOULD BE ATTEMPTED WITHOUT THE ADVISE AND COUNCIL OF AN ADVISORY COMMITTEE PROPERLY CONSTITUTED WITH REPRESENTATION OF LABOR, MANAGEMENT AND THE PUBLIC.

(GIVE AN EXAMPLE OF AN INDUSTRY WHO ATTEMPTED TO GO IT ALONE.)
(GIVE AN EXAMPLE OF A VOCATIONAL SCHOOL THAT ATTEMPTS TO PROCEED WITHOUT THE INDUSTRY PARTICIPATION.)

THE WORK OF YOUR ASSOCIATION EPITOMIZES THE VERY PRINCIPLES VOCATIONAL EDUCATION WAS FOUNDED UPON--YOU ARE ENCOURAGING YOUNG PEOPLE INTO A RICH AND REWARDING VOCATION -- YOU HAVE DEVELOPED INSTRUCTIONAL MATERIALS AND MEDIA THAT ASSISTS OUR INSTRUCTORS DAILY -- YOU HAVE STAFFED AN ASSOCIATION WITH HIGHLY QUALIFIED PERSONS TO RELATE TO AND COUNCIL WITH EDUCATORS ON PERTINENT INDUSTRY NEEDS AND REQUIREMENTS AND MORE THAN THAT YOU HAVE SUPPORTED VOCATIONAL EDUCATION AND OUR ATTEMPTS AT DIRECTING THE TRAINING OF YOUNG PEOPLE IN HIGHEST TRADITION OF CRAFTSMANSHIP.

DURING FY 1967 STATE DEPARTMENTS OF EDUCATION TRAINED, THROUGH TRADE AND INDUSTRIAL EDUCATION 10,847 PERSONS IN ELECTRONIC OCCUPATIONS, 21,100 IN RADIO/TELEVISION SERVICING AND APPROXIMATELY 4,000 IN OTHER ELECTRONIC OCCUPATIONS OR A TOTAL OF 35,000 PERSONS AND I CAN ASSURE YOU THAT THIS COULD NOT HAVE BEEN DONE WITHOUT YOUR INDUSTRY, YOUR ASSOCIATION AND EDUCATION STANDING SIDE BY SIDE IN THE PROCESS. WE IN GOVERNMENT AT THE LOCAL, STATE AND FEDERAL LEVEL LOOK FORWARD TO A LONG AND CONTINUED PARTNERSHIP IN THIS TRADITION. THANK YOU.

*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968

Power is a necessity in modern organizational relations. Favoring the participation of women is the fact that both sexes are finding greater freedom to express their own potential for personal development through the more realistic evaluation of their own individual differences. Each individual is experiencing greater spontaneity and greater satisfaction in being himself or herself. In order to fully utilize her potential to exercise power, each woman should: (1) make use of existing opportunities to utilize ability, (2) secure the training or education to qualify for high-level jobs, and (3) develop a vision of what she wants for herself and other women. The appendix includes brief discussions of structural, process, decision-making, and systems approaches to administrative organization. (JK)

Luncheon Theme: "FOCUS ON WOMANPOWER IN OUR TOTAL EDUCATIONAL ENVIRONMENT"

DYNAMICS OF THE ORGANIZATIONAL POWER STRUCTURE

> "Organization structures set people in certain relationships of authority, influence, and dependence; is communicated to members by delegation of duties, responsibility, and (levels of) authority; and the amount of each should be relatively equal. Structure focuses on the job rather than the person who fills it....while organization sets the relationship between people, work, and resources."[1]

It has been evident to me for some years that policies on vital matters affecting large organizations seem to appear suddenly. They are acted upon at a "house of delegates", perhaps, but with no precise knowledge on the part of the majority of members as to how these policies originated or by whom they are really sponsored. Much is done, but much is left undone. Some of the things done appear to be manipulated to the advantage of relatively few. There usually appears to be a tenuous line of communication between the governors of such an organization and the governed.

The term power is no reified concept, but an abstract term denoting a structural description of social processes. Or, in simpler terms, "power is a word that will be used to describe the acts of men going about the business of moving other men to act in relation to themselves."[2] Peter F. Drucker states, "An institution is like a tune; it is not constituted by individual sounds but by the relations between them." (Davis, p. 305) Wherever groups of people exist in a common effort, organization must be employed to get productive results.

Organization structure is significant because it partly determines the power of people and their perceptions of their roles. In other words, individuals use organizations as instruments to achieve their goals just as much as organizations use people to reach objectives. One hypothesis

taken is that power is a necessary function in the organization, for it involves decision-making and it also involves the function of executing predetermined policies - or seeing to it that things get done which have been deemed necessary to be done.

In our society, people of authority are called power and influence leaders. Such leaders are men and women very like other men and women in many respects. The difference between the leaders and other members lies in the fact that social groups have apparently given definite social functions - those related to power - over to certain persons and not to others.

The descriptions of the workings of the power structure may not always look "good," but suggesting alternatives is not a primary concern here. Once power is defined - as the ability of men to command the services of other men - it is tempting to speculate on what commands should be, or should not be, given at any particular time.

Power is a relatively constant factor in social and organizational relationships with policies as variables. Variation in the strength between power units, or a shift in policy within one of these units, affects the whole power structure. Power of the individual must be structured into associational or clique patterns to be effective, thus most of the powerful national organizations have roots in smaller local groupings and interest groups. If the individual is interested in policy decision, representative democracy offers the greatest possibility of assuring the individual a voice in policy determination and extension. In fact, it may be the only course that appears open to him for possible inclusion in the upper power

groups. There is, perhaps, no other sure road to power participation.

This is not to say, by any means, that inclusion in an interest grouping will automatically catapult an individual into the realm of policy decision. He may never get there, but at least the road is still open. This holds true for the women particularly, who traditionally have been among the most neglected elements in the power picture. The gains in power participation by women have been through bitter struggles. There is no doubt that further gains will be made and with more bitter struggles. The leaders in the policy-making realm are not going to open the doors of participation with charitable graciousness.

It is true that the women in a group are the most inclined to lament their fate and the least inclined to participate in organizing activities which would allow them a voice in policy decision. Studies of job satisfaction show that women's dissatisfactions focus primarily on lack of promotional opportunities. It is here that they have their greatest difficulty securing equal opportunity with men. Its meaning, in this case, comes from the world of science and from the larger American culture.[3] It uses the rationale, found elsewhere in our culture, that women do not have to work, as do men, and that women therefore do not have the same commitment to their jobs. That this is rationalization rather than reality is evident; just ask any woman. Women clearly express chagrin at their difficulty in pursuing organizational careers.

In spite of the limitations that confront women in relation to organizational participation on the level of policy decision, salary is based on factors other than sex: the organization does not subscribe to the definition

current in science of the role of the professional woman or the career woman so far as salary determination is concerned. It might seem that because service activities are negatively valued, women who perform them would be paid less. Apparently no relation between salary and performance of service activities exist; it is a no-system, a many-splintered thing. While her door displays the same title, and her salary check discloses the same monetary worth as on that of her fellow male junior executives, much of her time is spent in doing menial tasks or services not performed by them - so salary discrimination is not always the burning issue. The issue is that she doesn't find herself being invited with them to participate in the executive suite at the policy-making sessions. However, with proper attention given to structural arrangements of power in the organization, she may find ways of having a voice in determining who should be at the top. She may even be able to convince them it should be her!

It is not contended here that policy is determined entirely by behind-the-scenes manipulation, although the policy-makers tend to operate as a closed group. To the policy-makers, their activities are thought to be open and above board in relation to each other. Because of the structural hierarchy of command and decision, policy just appears to be determined behind closed doors. The situation, as I've observed it more closely these past few weeks, is that the policy-makers have a fairly definite set of settled tactics or policies at their command, which have been historically functional in the organization. New problems which may arise are measured by the standards of older policy decisions, and adjustments are made to fit new conditions whenever the situation warrants revision of older policy determination.

Often the demands for change in the older alignments are not strong or persistent, and thepolicy-makers do not deem it necessary to go to the people with each minor change. This pattern of manipulation becomes fixed, thus it is functional, and the ordinary individual (especially the female individual) in the organization is willing that the process continue. This is then carried over from the minor adjustments to the settlement of major issues.

In a given unit such as the organization, a smaller number of individuals will be found formulating the extending policy than those exercising power. All "men of power" are not, per se, policy makers.[4] Regardless, of such ideology, power is a necessity in modern organizational relations. No utopia will disband all organizational power relations. Some men and women will rule, others will be ruled. Or as the late Charles Kettering once said, "One composer can keep 10,000 fiddlers busy."[5]

The concept of organizing is simple, but it is difficult to effectuate. What is organization but the connection of parts in and for a whole, so that each part is at once an end and a means? A law circulated by Fred Allen on his radio show stated that "most things are more complicated than they seem to most people." Because power involves such complications - especially relationships between individuals and groups, both controlled and controlling - it can be described structurally, as I have done in the attached Appendix.

Concepts about womanpower and administration are shifting away from ideas about discrete roles and positions to a new focus on dynamic interchange, woman's output, and the benefits or services to be derived from her activity in concert with others. Women are the greatest potential

resource available for organizational building, yet in very few organizations are their skills being fully utilized, or are they making their full contribution to the groups to which they belong. What are some of the obstacles standing in way of full participation? What are some of the needs which must be met in order to make possible the development of their full potential in today's organizational world of work and group action?

All week we have looked at the kind of work world in which we are living; one of accelerated, radical, and irreversible change. The role of the woman in public life and some of the complexities she faces as a result of these changes, has taken on newer dimensions whether the woman is the owner, the manager, or the worker. But then the nature of woman and "woman's place" have always been controversial subjects.

Ranged on one side in the age-old arguments are those who believe that her uniquely female biological attributes do determine and should determine, every aspect of a woman's life. Strongly opposed to this point of view are those who emphasize the fact that sex is only one attribute of every complex human being, either male or female.

Perhaps some of these contradictions can never be fully resolved for all female human beings just because they are female as well as human. But little is to be gained by proposing solutions which fail to recognize that the world has changed in many ways since grandmother was a girl. Led by a small handful of indomitable women, the long, slow revolution which overthrew the undemocratic tradition of a legal double standard was accomplished without bloodshed or gunfire. When the final history of civilization is written, this declaration of feminine independence may well prove to be the

most enduring achievement of the twentieth century. Not only did it extend the concept of democracy to include a once excluded half of the population of the United States, it also forced upon every other country recognition of the truth that women, too, are endowed by their creator with certain inalienable rights. Now that is what I call dynamic organizational power structure!

In the solemn council halls of the United Nations the status of women has been established! In far-away lands, half-starved, illiterate women who have never heard the name of Susan B. Anthony have been granted equal suffrage. And around the conference tables of governmental and global planning, every decision made is in some way influenced by the implications of women's rights to political equality with men.

Women have become a political force to be reckoned with, and no office seeker can now afford to ignore them. Today, every political party has women on its local, state and national committees and men who once opposed women's suffrage on the grounds that female intelligence was too limited to grasp political issues have found it increasingly expedient to woo the "women's vote." They are not always wise in their wooing. Women candidates for public office are subjected to sly innuendo thinly veiled with flattery, while intelligent women voters are inundated with "guff for the girls" instead of platforms and policies. Inevitably women often feel themselves debased. Well aware that they are the equals of men in intelligence and anxious to use their training and ability in constructive or organizational or political activity, they must discharge their responsibilities as citizens by listening to men who consider them fools, men who find their bodies much

more interesting than their minds or souls.

Perhaps the most far-reaching change affecting women has been the new recognition of the worth of the individual. There can be little doubt that as women have found their way - or should I say - forced their way into the redoubts of business and the professions, the men have yielded inch by inch, especially in the hidden hierarchies of the professional associations. I guess it has something to do with the psychology of the male-commanding-elite who feel they have gone down the line in acceding to women's demands on many scores, but they'll be danged if they will let them take over the "holy of holies" in the command post of the executive suite.

No proclamation comparable to the Nineteenth Ammendment heralded the entrance of women into the organizational structure; the power for that frontier proved to be the typewriter. The typist became the career girl. Gradually time, familiarity, and necessity tempered early masculine hostility to a resigned shrug of the shoulders and the admission that "women are here to stay." While the hinges on many doors leading to economic and professional status for women are still a bit stiff and resistant, there is now no era of employment from which women are categorically barred.

What makes it worse is that after a succession of revolutions (suffrage, mores, job, kitchen, sexual) which left her liberated but wondering about the results of her freedom, the American woman is finally finding a life-style that suits her tolerably and makes a dent in her ancient problems. That problem has been variously phrased: whether to stick to the home or build a career; whether to compete with men or build a life around them.

However you put it, the fact is that the new American woman rejects the

need for making so stark a choice. She sees no reason why she and the male cannot join the functions of life that are best done together: the sexual, family, social, and work functions. And never has the need for the services of women been greater at the executive level - their skills, their judgement, their sense of fairness, their compassion, and their sense of commitment to build a better organization - a better future in which to work.

With the need so evident, and obstacles being removed, why do we then still talk about full utilization of womanpower? Why on examination of any situation do we find that women's full potential is not being used? New laws are being adopted but a law does not always become a fact in practice. Declarations against discrimination even agreed to by fifty states do not change everyone's attitudes or suddenly usher in new ways of thinking about the ability of women.

Never in the course of human history have men and women been entirely satisfied with the world in which they live. Motivated by restless impatience with the imperfections in their human situation, they have continually sought for ways to improve it. Through political rebellion, industrial revolution, and social evolution they have repeatedly discarded ways of their parents and ancestors in attempts to find new developments which seem to promise them a better way of life.

Our modern age is a time of transition between a past and a future. It differs from other eras only in the nature of the changes which have occurred and the rapidity with which they are changing. In this dynamic environment of change which characterizes their power structure, we must examine these relative values of democracy founded upon the belief in equal

rights of all men to participate in making decisions which affect their lives. This is because privilege without responsibility has never been available to human beings and the appeals of freedom and independence have never been compatible with conformity and reliance upon authority.

With every facet of our culture changing, the exact roles their parents played no longer have the same meaning in the new social pattern. This is what has happened to the young people of our time. They have been tinkering with the world in which their elders lived, urbanizing, industrializing, educating, and trying to democratize it, and as a consequence their parents' world isn't meaningful to them. Many of them are confused and angry about their inability to understand the new meanings now proposed for masculinity and femininity. Many seek to justify their behavior by trying to blame it on someone else, and when they can find no logical way to defend themselves from their own illogical accusations, they become angry even more. And their anger is directed at anyone they can accuse being the cause of their failure. But inwardly this anger is directed at themselves because they can find no way to counter the accusation of the ego-images they acquired from their parents. Forced by circumstances to accept this new role, they rebel against it emotionally because it is something they believe they should not be required to do; they are angry or fearful because they feel that what they are not doing is not right. This is organizational power structure, too. And it is not a power structure of juvenile delinquents or escapees of the "generation gap" but indolent misfits and law-defying miscreants given instant notority by omnipresent TV cameramen and headline seeking newscasters. Gradually, as new customs become established, attitudes towards them are

modified. I believe this would take place a lot sooner if we could keep the TV newseekers busy elsewhere.

Despite this illplaced power structure being exploited by a few, both sexes are finding greater freedom to express their own potential for personal development through the more realistic evaluation of their own individual differences. They are loosening the strings of their own self-imposed straitjackets to allow each individual greater spontaneity and greater satisfaction in being himself or herself, as he is or she is.

The first answer to the full utilization of women's potential is found in what women themselves do through their own efforts - the extent to which women take advantage of progress that has been made. It is found in their ABILITY to make use of available opportunities and their willingness to make laws work. We have the vote. How many use it? Forty percent of the women have never voted in the United States. Do the women who do vote insist on persons qualified to administer, willing to consider women's needs, with judgement to use our national wealth wisely to build an economy where there are firm job opportunities? We talk about women in decision-making posts but are we willing to stand for election ourselves to get into the party of our choice and work for higher standards? Yes, a few, despite the rigors of political campaigning and nonsupport from a good portion of the women who represent one-half of the population in the United States.

In economic affairs there is more prejudice to overcome. Dr. Reider points out it "takes a high degree of motivation to withstand the indignities to which women are subjected in the work world of women." The saying "pretty

good for a woman" makes us afraid to try, knowing twice as much is expected of a woman than of a man.

Granted there are top jobs women have refused because they don't want the extra responsibility required; more often it is that they don't have the qualifications - so the second answer is TRAINING: vocational training, technical training, professional training, specialized training. The revolutions of knowledge and technology have made most work highly technicized, and the male find refuge in his superiority in his specialty. The woman who has taken time (he says) to raise her children, and who now wants to come back has a whole vacuum of knowledge to catch up with. While she was raising her children, things have been happening that she doesn't know about, and that only the male - the glorious male with his unbroken continuities - can master. But this is hogwash, and the males know it. The American male is caught in a masculinity trap, wanting to show how male he is exactly when he wonders most about it. Give a smart woman the chance, and she'll catch up - vacuum and all.

The third answer is the VISION of what it is a woman can do with her ability, the need to think big with self confidence. It is not enough to want for oneself - one can't be human alone. A willingness to give of oneself for something bigger than oneself spurs one on to new undreamed of accomplishments. We all know that no joy equals the excitement of finding the real dimensions of ones own full potential, and the helping of other women to find and use theirs in order to raise the general level of participation. This means sharing skills and experience with the young women "coming up" in the organization as well as the young women in all your

Professional settings and in all your classrooms and counseling opportunities. Crossing the frontiers of ones own mind as well as ones country can be an exhilerating adventure. It means not only a global outlook but a sense of values that will serve as a balance wheel as new economic patterns are evolving.

It means the self discipline to act with direction to eliminate the many things not related to the primary interests; too much time is spent by women on unproductive but pleasant activities that deter them from reaching their goals. Equipped with these three, ability, training or education, and vision, women have the mechanics to exercise power and activate the forces to produce room in the executive suites. This exercise of power might be thought of positively, as following a plan or a program, rather than negatively, as waging a war with men. Too, practical effectiveness may well increase of women concentrate more on what actions are possible in the light of what they can do in any given context with their capacity rather than on what they are not allowed to do or what others should not do. For some crazy reason deep in man's mystique, having to do with his biology, man wants power and command, whether in the jungle of business or the real war of the jungles. The success and progress of any organization is dependent on such momentum and power. Let him have it.

Womanpower has within itself so marked a force to determine equal relationships with all members of the organization which reflect not only office in the organization but also personal attributes meaningful in a non-organizational frame of reference. It means the need for faith in women and the future of their work - knowing that the two great forces in

their lives are Eros and work - each in the broadest sense. Gradually, this same quality of interaction is beginning to be felt in every area of life where men and women work together. In organizations, in business and industry, in schools, and in research laboratories, women are making a contribution which is adding an important new dimension to the thinking of men. Not that the thinking of women is necessarily different in either quality or kind from the men, but the very fact that men are valuing the thinking of women is gradually deepening the insight of both sexes into the larger values to be found in a democracy which utilizes the contribution of all of its citizens.

APPENDIX

THE STRUCTURAL APPROACH

The modern approach to administrative organization started with a focus on how work should be divided and how this division of labor could be made more rational. The bureaucratic model of Max Weber,[6] the scientific management approaches of Gulick and Urwick,[7] the so-called "principles of administration" of Mooney and Reiley,[8] and the human engineering model of Frederick Taylor[9] all emphasized structural rationality. The underlying assumption was that all tasks could be separated into discrete parts and that job functions could be delineated by clear-cut boundaries between positions. These separate tasks to be coordinated through a hierarchial structure of authority. The superior in the scalar hierarchy had authority over the subordinate, but in a legitimate sense by reason of position rather than because of personal qualities. Thus, the smooth functioning of the organization was dependent upon how well the jobs were defined to prevent overlapping of function, and coordination was effected through the authority of the superior.

THE PROCESS APPROACH

As the scientific management model was gaining popular acceptance, we began to learn, through works such as those of Mary Parker Follet, that the social process within an organization must be taken into account. She presented this line of reasoning: "...our happiness, our sense of living at all, is directly dependent on our joining with others. We are lost, exiled, imprisoned until we feel the joy of unity."[10] In the literature on organization, references to the informal structure as separate from the formal

structure became popular. A great rash of studies on social process appeared, and concepts such as "human relations," "participative management," "interpersonal communications," and "motivation" became popular. Underlying most of this emphasis was the assumption that there is conflict between the individual and the organization, and the social process movement assumes that the needs of the individual should have primacy over the needs of the organization.* The problem of reconciling the structural orientation and the social process orientation has been difficult and has not been solved.[11]

THE DECISION-MAKING APPROACH

Simon, in focusing on the administrative process as a decision-making process, opened a new way of looking at the organization.[12] On the assumption first suggested by Barnard[13] that one could look at the organization as a cooperative system, Simon developed the concept of the "principle of bounded rationality," and outlined different kinds of objective rationality, arguing that the central core of administration was the decision-making process. The literature on organizational decision-making is extensive, but the major issues evolved around the economic model of rationality, with arguments about whether it is an effective model in considering organization behavior.

THE SYSTEMS APPROACH

In the late 1940s some new concepts began to emerge and generated new ways of thinking about the administrative organization. Cybernetics, information

*Chris Argyris probably represented the extreme in this point of view, although his current work does not take such an extreme position.

theory, mathematical decision-making, and particularly the idea of systems brought completely new conceptual orientations to the world of management. In attempting to solve certain operational problems, they were perceived as created by a system of interacting variables rather than discrete causative relationships. The techniques of "operations research," or the systems approach, are based on the underlying assumption that the whole consists of interacting systems that are in dynamic equilibrium. An organization is therefore a dynamic system focused on the process of guiding the organizational output. With these conceptual developments of system, feedback, and control, the individual is incorporated as a dynamic sub-system in the organization, or, "depending on the problem or sub-system under study, the individual might be viewed as a decision-maker, as an information-processing unit, as a constraint, etc."[14] Most importantly, this new dynamic model focuses attention on the output of the system rather than on a rational structure or a social process. We are no longer tied to an attempt to reconcile the inconsistencies of the old, so-called "principles of administration" with conflicting theories of individual needs. This change does not eliminate the problem of administrative integration, coordination, and control. It does, however, open the way for learning a great deal about organizational behavior and for finding new and more effective organizational forms. With the focus of attention on output, such a change should profoundly affect our assumptions and ideas about the functions and roles of womanpower, especially in the situations in which women are members of an administrative organization.

*SPEECHES; *INDUSTRIAL ARTS; *FELLOWSHIPS; *SAFETY EDUCATION; MATERIAL DEVELOPMENT; PROGRAM ADMINISTRATION
*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968

Five speeches presented at three general meetings are on the topics of joint fellowships with industry and education, the changing image of work, and safety. "The Development of a Fellowship Proposed" by George J. Brown suggests the needed ingredients of a fellowship proposal. "Conducting an Experienced Teacher Fellowship Program" by G. Harold Silvius presents the major elements of a fellowship program at Wayne State University. "Instructional Methods and Media for Implementing New Industrial Concepts" by Jack Kirby relates the role of instructional materials development in the fellowship program at Wisconsin State University at Platteville. "The Changing Image of Work in Our Society" by Howard F. Nelson reviews sociological and psychological factors involved in the concept of work. "Safety: In School and on the Job" by Herbert Siegel relates safety to the industrial arts instructional program as taught in New York City. (EM)

THE DEVELOPMENT OF A FELLOWSHIP PROPOSAL

INTRODUCTION - Why a fellowship proposal?

Possibly the question should be reversed and stated: Why are you here this morning? It would appear the lure of outside funding is most attractive, but in addition to the funding, the opportunity to improve, to innovate, to constructively change, to research, and to profit by outside help are also significant motivating factors. In part, your goal may be to become a participant and add to your educational preparation. Regardless of your goal, the opportunities are many.

The technological advances of recent years along with the increasing pace of technological change has placed industrial-technical education in direct focus of industry. Industry is concerned with what you are teaching. Their concern extends beyond a simple verbal expression; and for those of us who care to try, the technological gap may be spanned with an industry-education partnership. The partnership has undergone a recent revival. The revival of this partnership has possibly been stimulated in-part by the various federal acts under which proposals may be made. The recent federal acts to consider in the future includes: The Professional Development Act of 1968, the 1968 Amendments to the Vocational Education Acts, and the 1968 Amendments to the Higher Education Act. In addition, there are many foundations, industries and other services.

The industry-education partnership is a dynamic way of placing a static educational situation on the move. Let us look at four basic questions associated and closely related to the proposal.

How Extensive Should a Proposal Be?

The extensiveness of a proposal should be exemplified by evidence of planning. How much planning should really be done before a proposal is submitted. A proposal could certainly vary from a simple verbal expression to a rather detailed and worked out plan. For example, I might propose an eight-week institute in the area of Techniques of Material Testing and Analysis for this summer. Further, I might state intent to have speakers, equipment, etc; but compare the other extreme with all speakers tentatively contacted, equipment scheduled, etc. The proposal gains in pot ential with the level of planning.

The crux of the problem is what happens if the proposal is not approved. Should all the work be lost? Benefits are derived from planning. Possibly the proposal may be operated without funding, shortened in length or portions may be converted into the regular program. Certainly the local situation will provide the environment in which this problem may be answered.

What Criteria Should Be Considered?

What makes a proposal a good proposal? Many ingredients could be stated. One, however, stands out. The uniqueness of the proposal to provide for educational innovation. It is not

the intent here to be critical of what is taught now, but rather to point to the fact that generally industry-education partnership is seeking more from the school than what has previously been offered. Therefore, the program proposed must be unique by providing for tomorrow.

Uniqueness may well be keyed on a method of teaching, content relationship of industry-education or program articulation patterns.

For example, where are the institutes associated with simulation, gaiming, teaching machines, educational systems and other instructional media.

Is it absolutely necessary to remove stock on a lathe, or might a simulation lathe be designed to provide the same educational experience? Is student teaching experience absolutely necessary or might a prospective teacher present his lecture to a system which analyzes it for content, provides a play-back, and offers a student-teacher dialog. Such response could well be in terms of discipline and as well as content.

The seventies will be marked with progressive change. Today's unique proposals will lead the way for tomorrow's educational programs.

What Costs Are Involved?

To a great extent, costs are closely associated with the institution, the type of proposals, etc. Generally, costs may be divided into direct and indirect costs. Direct would normally be defined as salaries, stipends and material or equipment costs.

Indirect would typically include general institutional overhead costs. A proposal must be measured in terms of the school's participation.

The importance of cost should be stated in terms of a question? What is your university, school or department willing to support. As a typical expression, is your proposal willing to go "dutch", or is your hand extended all the way?

What Are The Staff Requirements?

The educational staff becomes most important. To write a proposal is by far the smallest part. To direct and supervise the on-going operational phase, to account for funding and seeking institutional arrangements require a staff willing to work. I recall well the morning the guest speaker was late, the company that cancelled the field trip because of their strike, and the business office which charged the wrong account and so on.

Summary

To attempt in a few minutes to cover all the details of a proposal is, of course, impossible. The industry-education proposal must, however, exemplify careful planning, uniqueness in educational advancement, financial willingness of the institution to participate, and a qualified staff willing to work. The final success of a proposal may be equated in many ways, but the worth must be measured in the final educational value to the participating student.

Dallas Convention

American Vocational Association

December 12, 1968

FELLOWSHIP PROGRAMS IN THE INDUSTRY-EDUCATION PARTNERSHIP

Participants:

Leslie H. Cochran, Wayne State University, Chairman
George J. Brown, Wisconsin State University-Platteville
G. Harold Silvius, Wayne State University
William D. Wolansky, Oregon State University
Jack Kirby, Wisconsin State University-Platteville
Orin L. Buchleiter, Albuquerque, N.M.-Public Schools

Topic #2:

"Conducting an Experienced Teacher Fellowship Program"

by

G. Harold Silvius

Because of the limited time that could be devoted to such an involved topic, my remarks will be delimited to three major considerations:

I. It is essential that the program be closely associated with one or more community school systems so that developed instructional material may be field tested.

A. The WSU Program is identified with the two job clusters of the Galaxy Plan of the the Detroit Public Schools for Career Preparation (See attached Tables 1, 2, and 3).

B. Teams of Fellows and Detroit teachers from four selected inner-city schools, with assistance from the Department heads in these schools, develop units of instruction to be field tested with the regular scheduled classes in these schools.

1. Selected students from classes where the instruction will be later presented, assist with the Micro-Teaching process employed in the development of this instruction.

2. The resource materials developed to support these instructional materials are then made available to all of the regular Detroit teachers in inner-city schools, as well as to the Fellows for use in their urban school systems.

C. With differentiated staffing, flexible modular scheduling, computerized program instruction loopfilms and other visuals, closed circuit television, and an information retrieval system, it is now possible to provide an individual student, a small group of learners, or a complete section of students with a needed exploratory or depth experience in some one subject area. Such methods and instructional aids are essential to a broad-based approach to occupational education, now so essential at the comprehensive high school level (illustrated by Figure 1, attached).

II. A concomitant of the program has been leadership development. This comes as the Fellows get involved in (1) the planning, the conducting, and the evaluating of the conferences scheduled as national leaders come to the campus; (2) helping other Fellows in need of remedial instruction; (3) assisting a professor with some aspects of instruction,where the competence and experience of a Fellow might well be employed and featured; (4) helping with the program and activities of the Industrial Education Guild (the departmental organization that provides social and professional activities for all of the active students in Industrial Education at WSU); (5) assisting with the internal evaluation of the on-going program; planning and making video tapes for the WSU informational retrieval program; and (6) preparing copy for the Guild News published by the Department and sent to life members of The Industrial Education Guild and selected national leaders in the field.

III. It is believed that the "En Bloc" experiences, suggested by the U.S. Office of Education, have been a major factor in the success of the WSU Program. This is illustrated with selected slides taken in the headquarters facility provided for the exclusive use of the Fellows at WSU.

FELLOWSHIP PROGRAMS IN THE INDUSTRY - EDUCATION PARTNERSHIP

TOPIC:

Instructional Methods and Media for Implementing New Industrial Concepts

PRESENTED BY:

Jack Kirby, Head
Department of Industrial Education
Wisconsin State University-Platteville
Platteville, Wisconsin

December 12, 1968
Dallas, Texas

Program Chairman
Leslie H. Cochran

Fellowship programs, as I see it, have one prime objective--to better prepare teachers for their work in educating students. This is accomplished in two ways. First, the knowledge of the teacher is increased - knowledge of the subject area and knowledge of teaching techniques related to that subject area. Secondly, the teacher's ability to impart this knowledge is improved.

I would like to discuss with you briefly some points in connection with the second part - the teacher's ability to impart this knowledge. To aid in this aspect of a fellowship program, instructional materials become vitally important. In order to do an effective job of teaching, a teacher needs tools with which to work. Fellows in a fellowship program look for these tools as outcomes of the program. Let me comment on three main points in connection with instructional materials - (1) developing them, (2) trying them out, and (3) dissemination.

Since our programs deal with studying industry or some aspects of it, industry becomes a very valuable resource for developing instructional materials. Industry, at the present time, is most cooperative and in most cases, will make their facilities and/or personnel available for the development of these materials. My experience has shown that this relationship with industry is desirable in connection with getting a proposal approved as well as a desirable relationship insofar as the staff and participants are concerned.

What types of materials am I referring to? Let me briefly describe the materials that we have developed as a part of our fellowship programs at Platteville. First, there are many types of written materials which can help the participant as he works in the program or when he returns to his school to teach. These materials map out the content to be covered and/or describe methods of presenting the material to the students. Materials such as study guides, teaching plans, bibliographies, activity sheets, etc. fall into this category. While some of this needs to be done prior to the arrival of the participants, it is most desirable if they can get involved in the development of these materials.

Industry becomes involved in this insofar as the materials developed are a result of the study of industry or some aspect of it. In the program at Platteville, extensive visits to a wide variety of industries were made with the Fellows and the written materials were developed based on these visits supplemented by other study methods.

Along with the visits, we requested the opportunity to take colored slides. Initially, these slides were to help us develop the written materials by allowing us to throw a slide on the screen and help us recall that part of the industry. However, it appeared that these slides could also have instructional value at the secondary level; consequently, colored slide series were developed, with scripts, that could be used by the Fellows in the program. Industry was most cooperative here and personnel from the various industries edited the scripts so that they are technically correct. Colored slides bring industry into the schools and provide an instructional aid that has proven to be quite effective.

One final instructional media which I believe has tremendous possibilities is video tape. Video tape permits a realistic view of industry. In developing a video tape, industry most certainly must be a partner since considerable cooperation and help is needed. It is also necessary to have the necessary equipment for this as well as a technical crew to operate the equipment. Both are possible and video tape appears to be a desirable instructional media, both from the standpoint of value to the Fellows as well as a good feature for getting a proposal funded.

The utilization of these instructional materials also becomes an important part of a fellowship program. While not always possible, it is most desirable to utilize these in a real situation during the on-going stages of the program. This requires the co-operation of local schools in the area or a campus laboratory school. In our program at Platteville, we had an internship built into the program in which the Fellows actually taught for a period of time using the instructional materials that had been developed. This gave them a chance to try them out under the supervision of the program staff. If this is followed by a re-evaluation session by the Fellows prior to their return to their schools, then the materials should be ready to use when they return.

The dissemination of these materials may take on two forms. Written materials generally would be taken with the participants in the program as the program is completed. In some cases, slides may also be taken with the participants. However, generally slides,

video tapes, etc. would be retained by the school and made available on request by the participants or any others who may wish to use them.

Funds for the development of these materials might well be a concern at this point. Generally, the fellowship program will have support funds to provide the materials, technical support, and some equipment for this purpose. In addition, industry will also aid by providing resource people, slides, literature, and other support.

In summary, the development of instructional materials for a fellowship program is a most desirable outcome and will aid in the achievement of the goals of the program. The partnership of industry and education in this endeavor is both desirable and necessary.

The Changing Image of Work in Our Society[1]

The image of the world of work in America and the very image of work itself is radically different today than anything in any country at any time in history.

In this short presentation today, I do not propose to belabor you with a detailed characterization of the world of work because all of you have been deluged with discussions about the new developments in automation, science and technology. You are aware of the heavy increase in the number of female workers entering all fields. You have heard the estimates given far and wide that two-thirds of the next generation of workers will be occupied in jobs which do not exist today. You have come to know about many of the perfectly fantastic kinds of innovations which are upon the technological threshold just waiting for exploitation. Actually, you are witness and participant to many of these changes. You hold membership in an affluent society in which financial security and available work upsets the long-held view that hard work was firmly founded in an economy of scarcity. This development in turn upsets our former understanding of patterns of labor supply and demand.

But I haven't been asked to discuss the world of work, but rather, the changing image of work itself. This topic alone is a multi-faceted conglomerate of variable dimensions and aspects quite difficult to describe. There are simply so many different

[1]Presented by Howard F. Nelson, Professor and Chairman, Dept. of Industrial Education, University of Minnesota.

meanings associated with work.

Perhaps before I continue further and attempt to isolate changes in the image, it would be wise to provide a definition of work as a base for our discussion. Personally, I prefer Wrenn's[1] definition in which he tells us, "Work is activity calling for the expenditure of effort toward some definite achievement or outcome. Paid or not, hard or easy, it is always effort toward a specified end." I like this definition because it seems to be socially and religiously neutral in orientation.

Historically, of course, the meaning of work has derived from two main sources, one social and one religious. The social derivation of work as a worthwhile activity which possesses virtue for its own sake, is easy to comprehend. Work has always served man as the basis of his dignity as an individual. Even though he possessed little more than brain and muscle, he belonged to society because he performed services needed by it.

From the religious standpoint, the meaning of work is derived from a mixture of emphases. The Catholic view that work is essential, but subordinate to living for the next world, and the Protestant view that one must work hard in this world and get ahead because God condoned and even expected it, have become intermixed to constitute our presently held concept of work.

---

1. Henry Borow, ed. Man In A World At Work. Boston, Mass.: Houghton Mifflin Company, 1964. p. 27.

While this may be an overly-simplified conception of the roots of our beliefs about work, there remain many dimensions worthy of exploration. Work is ubiquitous. In many respects, it constitutes the umbilical cord between man and society. It determines a person's way of life, especially as it applies to one who heads a household. There are the obvious, conscious, psychological justifications for work--self-preservation, if you will, the normal desire to have, support and raise a family, and the basic satisfaction derived from occupational relationships associated with a type of work. No doubt, this aspect would be of greatest interest to the economist who sees work as a means to an economic end.

But it may also intrigue the psychologist or psychiatrist when attitudes toward work become the focal point of examination. While its origin is unknown, all of us have read the statistic that between 60 and 80 per cent of all persons who have been dismissed from work have been dismissed not for lack of competence and technical skills, but rather for reasons which are largely attitudinal in nature. These are persons who have never really learned to work as we presently define that activity.

At the same time, work affords a psychological outlet for a person's energies whether they be hostile or aggressive. Work is always directed toward something as Wrenn has stated--always toward an end. And in many cases, the person involved may only strive to satisfy a need for approval--perhaps of his

supervisor, fellow workers, or some other assumed important individual.

For people who have somehow failed to learn the basic lessons concerning how to get and hold a job, and how to get along with colleagues--persons who wander aimless paths from job to job and who flail about in all directions seeking their solution--these are another population who are handicapped as surely as those who lack the basic competencies of work.

Although I alluded to this earlier, Miller[2] has raised another interesting contradiction between work and leisure which originates with, but is not relevant to the present affluent circumstances in which we live today. He tells us:

> We believe that man's purpose in life is to demonstrate his worth through work. Man should save and build for himself, his family, and his future. But we are told that we should live well and accept the promise of ever greater leisure and prosperity. Work occupies fewer hours and years in the life of most people. What work there is grows less like work every year. The virtues of hard work and profit are rooted in scarcity. They have no relevance in an affluent society.

The time allowed for this presentation will not permit further pursuit into additional varieties of worker dislocation and difficulty, but perhaps it will provide a sufficient overview for the moment so that we may focus on some specific implications of the main topic.

For my assignment today, one of the most significant contributions to the literature has been Seymour L. Wolfbein's[3]

---

2. Ibid., p. 101

3. Ibid., Chapter VII, pp. 155-168.

discussion of, "Labor Trends, Manpower and Automation", in which he provides an assessment of changes and how these have affected the present scene and are bound to affect the future. I have leaned heavily on this Chapter Seven for my talk and have even adopted his discussion titles and charts.

Wolfbein analyzed seven major faces of change which he dealt with under the following questions: (1) What part of a person's life is spent in work? (2) Who works in the United States of America? (3) What do they produce in their work? (4) What kinds of jobs do they perform? (5) Where do they work? (6) How efficiently do they work? and (7) What kinds of preparation and background do they bring to work?

1. The Changing Length of Working Life

Perhaps there is no index of greater significance to a nation's social and economic welfare than an analysis and charting of the years of expected working life. From such an analysis, one can determine the duration of that portion of a person's life-span which is devoted to work. In addition, one can learn at what age the new worker enters the labor market, the time spent in education and training, and the time of exit from formal work.

Table 1

LIFE EXPECTANCY AND WORKING LIFE AT BIRTH IN THE UNITED STATES, 1900–1955

Year	Men			Women		
	Life Expectancy	*Work Life Expectancy*	*Years Outside Labor Force*	*Life Expectancy*	*Work Life Expectancy*	*Years Outside Labor Force*
1900	48.2	32.1	16.1	50.7	6.3	44.4
1940	61.2	38.3	22.9	65.9	12.1	53.8
1950	65.5	41.9	23.6	71.0	15.2	55.8
1955	66.5	42.0	24.5	72.9	18.2	54.7

Table 1 summarizes this kind of information for us. By reference to it, a baby boy born at the turn of the century would be expected to live twenty years less than one born today. Girls gain another two years. Since these data are based on averages, one of every eight men may expect to reach eighty-five years and one in four women are reaching that age now. The major change here is in the duration of life and the accompanying changes in outside-the-work activities which includes education and training at the beginning of the life-span and the increased period of retirement at the end of work.

The average young man of twenty today can expect at least fifty more years of life with about forty-three in work and seven in retirement. Fifty years ago, there was little difference in years between the work-span and the life-span. Yet a young person today will work many more years because of the increased life-span. Since 1900, ten years of working life have been added for men and twelve for women. One can multiply these gains by the number of young people entering the labor market per year and get an estimate of the total gain to the work force.

What may we draw from these kinds of data? Certainly the enormously increased work-life-time, greater amounts of time for education, leisure and recreation represent the major elements.

2. The Changing Composition of the Work Force

Table 2 summarizes pertinent data to show a decreased

amount of participation in work by men at the beginning of the work-span and at the end, a circumstance which is then counterbalanced by the sharply increased number of women in the work force.

Table 2

LABOR MARKET PARTICIPATION RATES BY AGE AND SEX, 1900, 1950, 1960
(per cent)

Age	Both Sexes			Male			Female		
	1900	1950	1960	1900	1950	1960	1900	1950	1960
All ages	53.7	54.0	55.3	85.7	79.4	77.4	20.0	29.3	34.5
14–19	44.4	31.6	26.9	62.1	39.9	32.0	26.8	23.0	21.8
20–24	60.8	62.6	61.9	90.6	82.5	83.2	31.7	43.6	44.3
25–34	58.3	61.7	64.5	94.9	92.5	94.9	19.4	32.0	35.4
35–44	57.1	64.8	68.5	94.5	95.2	95.5	15.0	35.2	42.7
45–54	56.0	62.7	68.5	92.8	92.5	92.7	14.2	33.1	46.3
55–64	50.5	53.7	59.2	86.2	83.9	85.1	12.6	23.6	34.3
65 and over	36.0	23.8	19.0	63.1	41.5	29.7	8.3	7.9	10.1

Thus, the proportion of persons of labor force age who are engaged in the labor force has changed very little. You will observe that in 1900, 53.7 per cent of all persons 14 years of age and older were working; in 1950, the figure stood at 54 per cent, and in 1960, it amounted to 55.3 per cent--virtually no change. While there has been little external change, the internal change has been revolutionary.

One of the most dramatic changes shown in Table 2 is the reduction in numbers of teen-age boys employed in the work force. In 1900, two of every three were workers; today, only one-third are so engaged, and there appears to be no abatement in the trend.

As a counterbalance to this trend has been the marked

increase in female workers in every age bracket except among the teen-agers. One should note especially, the rise in employment of women, thirty-five years of age and older, and the heavy increase in numbers of women from the 45 to 54 age group. On the average, a present day American high school girl can expect to devote twenty-five years of her life to work after taking time out for marriage, child bearing and similar diversions.

3. The Changing Industrial Structure

If one were to pin-point one factor as perhaps the most important change in the industrial structure, it would have to be the flow of people from the rural, farming areas into the urban centers with their manufacturing service producing activities. As recently as 1940, one-fifth of our workers held farm jobs while today, that proportion has been sliced in half.

If a second characteristic change in industry were to be isolated, it would have to be the markedly increased productivity per worker. As of about 1950, we became the first major nation in the world to employ more persons in the service-producing industries than in the goods-producing part, and the trend seems to be continuing.

Table 3

WAGE AND SALARY EMPLOYMENT BY INDUSTRY IN THE UNITED STATES, 1960
(thousands)

Goods-Producing Industries		*Service Producing Industries*	
Agriculture*	5,723	Transportation and public utilities	3,923
Construction	2,882	Trade	11,365
Mining	709	Finance, insurance	2,748
Manufacturing	16,762	Service	7,514
		Government	8,831
Total	26,076	Total	34,381

* Includes self-employed and unpaid family workers.

Table 3 presents this kind of dramatic evidence; the left-hand division shows the number of workers deployed in the goods-producing activity while the right-hand block records the service-producing group. Persons who are self-employed are not tallied here, and since most of them are in the service industries, the actual difference in numbers would be more startling than Table 3 now shows.

What does all this mean? For one thing, it tells us that our capability for producing is so refined that we alone as a nation, can afford to have this kind of worker distribution.

4. The Changing Occupational Standings

As we have discussed the three previous elements of change, one may not assume that each one is a separate entity in itself because the impingements of each element, within and between can be subtle as well as massive. In any event, when the three previous sets of factors are poured together, the picture depicted in Table 4 emerges.

Table 4

OCCUPATIONAL DISTRIBUTION OF EMPLOYED PERSONS
(in per cent)

	1910	1950	1960	1970*
White-collar	22	37	43	45
Professional, technical	5	9	11	13
Proprietary, managerial	7	9	11	11
Clerical, sales	10	19	21	21
Blue-collar	37	41	36	36
Skilled	12	14	13	13
Semiskilled	14	21	18	18
Unskilled	11	6	5	5
Service	10	10	13	13
Farm	31	12	8	6
All workers	100	100	100	100

* Estimated figures for 1970 based on projections.

Because of developments, it is inevitable that we would find more people in the white-collar occupations than in the blue-collar jobs. Part of this occurs because of the enormous reduction in the unskilled job categories and the escalation of education and training necessary for employment in almost every work classification.

In conjunction with this situation, one is reminded of the statement quoted in the April, 1965 issue of Phi Delta Kappan to the effect that, "The machine now has a high school education in the sense that it can do most jobs that a high school graduate can do, so machines will get the jobs because they work for less than a living wage. A person needs fourteen years of education to compete with machines." Willard Wirtz who made the statement, suggests that any high school senior who has doubts about whether to seek a higher education faces this rather unflattering proposition.

Table 4 gives us several major lessons which need identifying. The skill level of the entire work force is increasing and will continue; more education and training must be provided if the present increase in productivity per worker is to keep pace with the need for greater production of goods and services.

5. The Changing Georgraphy of American Industry

One of the most interesting and significant changes in work relates to the geographic dispersion of industry throughout the country. Since 1947 and up to the present, the

non-agricultural installations have made dramatic moves toward some areas and away from others.

Table 5

NON-AGRICULTURAL EMPLOYMENT IN THE UNITED STATES, 1947 AND 1960

Geographic Division	Number (thousands) 1947	Number (thousands) 1960	Per Cent Change 1947–60
Continental U.S.	43,329.2	53,708.6	24.0
New England	3,331.4	3,707.3	11.3
Maine	262.8	277.5	5.6
New Hampshire	166.7	197.6	18.5
Vermont	99.0	107.0	8.1
Massachusetts	1,731.1	1,916.7	10.7
Rhode Island	298.0	291.7	−2.1
Connecticut	773.8	916.8	18.5
Middle Atlantic	10,813.2	11,901.5	10.1
New York	5,557.7	6,170.8	11.0
New Jersey	1,621.6	2,011.6	24.1
Pennsylvania	3,633.9	3,719.1	2.3
East North Central	10,005.9	11,522.2	15.2
Ohio	2,666.7	3,147.2	18.0
Indiana	1,194.2	1,431.4	19.9
Illinois	3,145.4	3,417.4	8.6
Michigan	2,013.7	2,334.3	15.9
Wisconsin	985.9	1,191.9	20.9
West North Central	3,404.4	4,194.5	23.2
Minnesota	765.8	959.8	25.3
Iowa	576.7	678.8	17.7
Missouri	1,126.8	1,347.9	19.6
North Dakota	97.4	126.3	29.7
South Dakota	109.5	141.5	29.2
Nebraska	301.4	381.2	26.5
Kansas	426.8	559.0	31.0
South Atlantic	5,261.2	7,216.0	37.2
Delaware	110.5	153.8	39.2
Maryland	673.3	896.4	33.1
District of Columbia	476.6	535.7	12.4
Virginia	772.1	1,017.6	31.8
West Virginia	512.3	459.9	−10.2
North Carolina	879.6	1,195.5	35.9
South Carolina	436.0	582.5	33.6
Georgia	759.4	1,051.1	38.4
Florida	641.4	1,323.7	106.4
East South Central	2,123.3	2,751.4	29.6
Kentucky	521.2	653.6	25.4
Tennessee	700.5	918.0	31.0
Alabama	610.4	776.4	27.2
Mississippi	291.2	403.4	38.5
West South Central	3,049.8	4,270.4	40.0
Arkansas	286.1	367.3	28.4
Louisiana	592.4	789.8	33.3
Oklahoma	437.3	581.6	33.0
Texas	1,734.0	2,531.7	46.0
Mountain	1,169.5	1,871.9	60.1
Montana	138.2	166.7	20.6
Idaho	122.6	155.2	26.6
Wyoming	73.2	97.3	32.9
Colorado	335.0	514.4	53.6
New Mexico	122.7	236.3	92.6
Arizona	145.7	333.8	129.1
Utah	178.5	264.8	48.3
Nevada	53.6	103.4	92.9
Pacific	4,170.5	6,216.8	49.1
Alaska			
Washington	670.9	812.6	21.1
Oregon	419.6	509.2	21.4
California	3,080.0	4,895.0	58.9

The per cent of changes of this type are well illustrated in Table 5 in which States like Arizona, Florida, New Mexico, and California exhibit startling growths in employment, while States like West Virginia, Rhode Island have lost ground, and Pennsylvania, Maine, Illinois, and others have been virtually static so far as employment is concerned.

By simple calculations from this table, it will be observed that one out of every six jobs in this country is found in California, Texas, and Florida. Of course, these data obscure growth of another nature. For example, New York, which

now has the lion's share of employment in non-agricultural occupations, shows little growth. Table 5 fails to show the increase in financial institution employment, and in the case of Connecticut, the employment in insurance related occupations.

What do these data suggest? The principal lesson seems to be that the population moves to where industry locates, and secondly, industry often builds where there are skilled or trainable people to man the plants. All of this adds up to a fine illustration of the internal mobility of Americans.

6. The Changing Productivity of the American Worker

When one studies the production achievement of people, world wide or in America, there are two typical ways in which to increase worker production. One involves an increase in the proportion of people deployed to the production of products and the second involves lengthening the work day and week to get more production out.

Neither of these techniques has been used here. What has happened is that we have tripled our production per capita of employed persons and have not increased the proportion of population engaged in production. And in almost all cases, the hours per week involving work have been reduced, whereas the rate of production per person has been improved.

Table 6

INDEXES OF OUTPUT PER MAN-HOUR, 1947–61
(1947–49 = 100)

Year	Total Economy	Agriculture	Non-Agriculture	Manufacturing	Non-Manufacturing
1947	96.7	90.5	97.5	97.5	97.2
1948	100.2	107.1	99.4	100.2	98.9
1949	103.1	102.2	103.2	102.5	103.8
1950	110.4	116.2	108.7	109.2	108.4
1951	113.1	114.5	110.5	111.2	109.9
1952	115.6	124.5	111.9	112.8	111.3
1953	120.2	138.6	114.9	118.1	112.7
1954	122.3	148.3	116.7	117.1	116.5
1955	127.6	153.5	121.6	125.3	119.7
1956	127.9	156.4	121.1	126.5	118.4
1957	132.4	166.7	124.7	126.8	123.7
1958	135.5	181.6	126.8	129.1	126.3
1959	140.3	181.1	131.4	138.7	128.1
1960	143.3	191.3	133.7	141.9	130.2
1961	148.2	205.6	137.6	146.5	137.6

This kind of development has been due for the most part to the mechanization revolution in which man and animal work has been largely eliminated by mechanical developments.

If one uses an index of 100 as a per man hour bench mark for production as of 1947-1949, and chart this kind of change through 1961, one can begin to understand the impact of this trend on productivity. From Table 6, one can readily see that agriculture has made the main increase in out-put and the smallest growth occurred in the non-manufacturing industries.

7. The Changing Educational and Training Prerequisites for Employment

When a country has a working population in which one in ten workers is unskilled and one in twenty is a professional person, and in a short period of time, this picture is flipped over where one in ten is a professional person and one in twenty is unskilled--this kind of educational change becomes

starkly delineated.

Not only have the educational requisites been rising in all fields where post high school preparation is necessary, but the occupational structure has also been exploding upward as well. The advent of automation and technological development can do only one thing in this situation, it must accelerate the need for better and more extensive preparation of people.

Table 7

AVERAGE YEARS OF SCHOOL COMPLETED AND EXPECTED PERCENTAGE CHANGE IN EMPLOYMENT BY MAJOR OCCUPATIONAL GROUPS

Occupational Groups	Average Years of School Completed (1959)	Expected Percentage Change in Employment (1960-70)
Professional and technical	16.2	40
Proprietors and managers	12.4	22
Clerical and sales	12.5	28
Skilled	11.0	22
Semiskilled	9.9	18
Service	9.7	26
Unskilled	8.6	0
Farmers and farm workers	8.6	−18

If one were to attempt to assess the impact of automation, another whole session like the present would be necessary. Fortunately, almost everyone in this audience knows a good deal about sensing devices, control mechanisms, feedback, computers, numerical control of machine tools and programmed assembly so that we needn't deal with them here.

For the most part, these automated mechanisms and devices have been applied thus far in the manufacturing industries and to a much lesser extent in all other areas. When these

developments do take place, then the educational and training requirements of workers must leap ahead again, even further than we have come in the last decade.

These are the major changes in the image of work in America, and for the data with which to make this presentation, a sincere expression of gratitude for the previous work of Seymour Wolfbein.

AMERICAN VOCATIONAL ASSOCIATION

Dallas, Texas

December 8 - 13, 1968

"SAFETY: IN SCHOOL AND ON THE JOB"

Prepared by: Mr. Herbert Siegel, Director

Thursday, December 12, 1968

2:00 - 3:30 p.m.

SAFETY EDUCATION

An important objective of industrial arts education is to provide for the development of safety habits in the school, home and community through the application and correct use of safe procedures in all shop activities.

School shop safety has always been an integral part of the shop instructional program. The inherent hazards of shop work with its machines, tools and materials requires that a considerable amount of attention be devoted to safety and accident prevention. The kind and amount of safety education is greatly dependent upon the attitudes, initiative, background and skill of the individual teachers. We as supervisors and directors should always be cognizant of this by stressing correct teacher attitudes. Instruction in the safe operation of machines and in the prudent use of tools and materials are a necessary part of all instruction given in the shop (laboratory). Verbal and written instruction should accompany each new process and operation as it is presented to the student and the teacher should be satisfied that the information is understood and will be utilized by them. Practically all examinations should contain questions on the proper use of tools and equipment.

Safety instruction given during the first days of the term should be designed to establish general safety practices in the shop. It should not be considered as the complete safety program for the term but rather as a brief introductory device for establishing learning and working conditions.

Suggested rules should be adapted to the specific shop situation, should be carefully explained, demonstrated, and if necessary dramatized, so that the reasons for them will be thoroughly understood by the students.

Emphasis should be given to the importance of relating safety instruction to the daily life of the student both in and out of school.

The ideal program includes not only safe environment and enforcement of official safety regulations, but also thorough instruction to the student, so that he will acquire the attitudes, knowledge, skills, and resultant safe behavior pattern to enable him to work safely, thereby avoiding accidents.

This publication "The School Shop Safety Manual" published by the Board of Education, City of New York, is a curriculum bulletin developed by teachers, supervisors and directors of our school system. It includes the

safety rules and approved safety practices pertinent to our schools. The regulations which are an integral part of this manual must be followed in all our schools. All teachers and other school personnel in charge of shop activities are responsible for the faithful and continuous observance of these regulations. These regulations have been promulgated as a result of continuous studies of the causes of school shop accidents. They are intended to reduce shop accidents through intelligent compliance. We also use a safety reporting system that alerts the principal and the Director of the subject area as to unsafe conditions that exist and a record of follow up procedures taken to remedy the situation.

IN CONCLUSION

Schools in general and school shops in particular have become increasingly more safety conscious. Learning safe work habits is imperative for safe living. The most effective safety education is that which is an integral part of the curriculum. Students learn best doing processes and operations correctly. Practice makes for perfection provided it is correct practice. Broad and successful learning experiences directed by competent instructors will produce safety conscious citizens.

School shops vary in layout and equipment. The student body also includes many variables. Therefore, safety education cannot be prescribed as uniform practices applying to every school and student situation. It is the purpose of the program to provide broad application with the understanding that specifics be developed to fit each situation and student.

"Custom-made" programs must be constantly revised to keep abreast of latest developments. Nothing but the best is good enough; nothing but the best will serve the purpose of developing in students those habits of safe practices upon which their health, happiness and usefulness will often depend. In terms of human suffering

one accident prevented repays the time and effort expended on safety programs.

Is Your Safety Program Up-To-Date?

This document contains one speech and the outline of two other speeches that were presented in business and office education general meetings at the annual American Vocational Association convention in 1968. Hermine Jeremias spoke on "Business Education Research in the Philadelphia Public Schools," a speech directed at ways in which research can assist in the elimination of trouble spots in business education. Garth A. Hanson described the use of simulation in conducting simulated office programs in Utah. Outlines titled, (1) Four Reasons for Having a Cooperative Program, (2) Five Phases of Selecting and Developing Training Stations, (3) Where to Go to Look for Training Stations, (4) Developing the Training Station, and (5) A Summary of What Does It All Accomplish? are included from a speech by Maxine Emery. THE SCHOOL DISTRICT OF PHILADELPHIA
Office of Research and Evaluation

---

*Address given at the American Vocational Association Convention
Dallas, Texas
December 12, 1968

I believe my charge today was to discuss the ways in which research can assist in the elimination of trouble spots in business education. Let me first take a moment to discuss the challenge of today's world to education generally and let us take a moment or two to remind ourselves of the place of business education, indeed all vocational education, in our schools.

The United States, the most affluent nation in the world, suffers from social unrest which is due in large measure to the steady decrease in the availability of jobs for the unskilled, and a simultaneous increase in the number of young people who are totally unprepared to meet the demands of skilled employment in our technological age. Philadelphia, in particular, while experiencing continued expansion and growth has, at the same time, been subject to persistent unemployment, especially among the city's youth. While young people, ages 14 to 24, comprise 18 per cent of the labor force, they account for 40 per cent of the total unemployed in the Philadelphia area.

Especially in times of crises, it is the schools in which solutions to these problems are sought. It has long been recognized that the skills, knowledge, and attitudes which are developed in many business education courses influence vocational success. Therefore, business education has both a responsibility and an opportunity; it seeks to provide students with salable knowledge and skills and assists in the transition from school to the world of work.

Because well-conceived programs can meet the vocational needs for nearly 70 per cent of our high school students, they are critically important curricula in secondary education, and, as such, merit periodic examination and evaluation. Obviously, in this context, business education as a part of the entire gamut of vocational education programs must meet the same criteria for examination. Additionally, pre-vocational exploration programs designed to foster healthy career development patterns at the elementary level also warrant serious consideration.

However, before changes in curricula, instructional practices and procedures can occur, an objective appraisal of existing conditions and practices--both strengths and weaknesses--must be made.

Generally, one might say that the identification of problems would be an important first step. I disagree. I believe we not only must think more positively about the role of the school, and the role of research in the service function to the schools, but we must first look at the forest and not the trees. Therefore, I believe that a thorough examination of the short and long-range objectives of business education curricula in the schools is an imperative ongoing process for business educators. To assist these curriculum developers define these objectives in behavioral terms becomes one of the major responsibilities for personnel in research. To this end, members of the Divisions of Vocational Education and Research meet periodically to define these objectives and determine priorities for research projects in the broad area of business education and to assist in defining individual project objectives.

I said previously, objectives must be defined before meaningful curriculum decisions can be made and problems can be defined. Consequently, the Research Division took as its first responsibility a broad examination of what vocational in general and business education specifically is expected to provide for its graduates. What are the goals of business education? To determine the objectives to which the Division should direct their immediate attention, a follow-up study was conducted of the 1966 graduates. The choice of this population for study was undertaken for several reasons. The Division of Research as it is currently functioning is a young organization. One year after graduation appeared to provide sufficient time to permit most students to have obtained employment and remain on the job long enough to describe their employment experiences. Employers too would be in a similar situation.

At this point, let me make an important distinction. Such evaluations of vocational business programs mean just that. While such programs as personal use typewriting and consumer education are admittedly valuable and have a distinct place in our high school curricula, it is not to these programs that our criteria for examination were based. Rather, students enrolled in traditional vocational programs which are designed to prepare students for the world of work were the focus of our study. Instead of the frequently-used mail questionnaire with its resultant problems, personal interviews were conducted with a random sample of graduates from all business curricula.

In addition to employment status, additional information was collected concerning gaps in training. Of interest to curriculum decision makers were the results of our statistical placement reports. While all business education programs accounted for 35% of the graduates, about 60% of all vocational graduates were engaged in some type of clerical activity as defined by the U. S. Census. Consequently, curriculum decision makers have sufficient data with which to make the types of school related activities relevant to the world of work. Additional information which was obtained from the follow-up study concerns the types of equipment utilized on the job. When it was discovered that many graduates found, from their employment experiences, that outdated equipment was one area in which the schools were found wanting, steps could then be taken to correct these errors. It should be added here that while purchase of new equipment might seem to provide a logical answer to combat this problem, other steps are being taken which, in the long run, may provide better assistance to combat this and other problems.

Philadelphia has long led the way in providing a comprehensive school work program to assist students make the transition from school to work. Not only do they have the opportunity to train on new and specialized equipment which the school is not always able to provide, but the variety of tasks which the students perform can assist in the development of a wide variety of work related skills for the

growing numbers of students to whom the world of work is an unfamiliar place. Such work programs can help narrow the gap between the skills required by industry and the ability of the school to provide realistic training, not only in basic skills required for all jobs in the area of business, but the immediate entry skills necessary for satisfactory job performance.

With this descriptive information as a basis for determining individual program objectives in specific terms, additional studies of a descriptive nature were undertaken in specialized curriculum areas. In addition to research of a descriptive nature, experimental research is also being conducted. The studies which have been developed answer basic questions and issues raised by current instructional practices or develop out of basic educational needs as evidenced by recent questions raised in the literature. They provide critical information needed by curriculum experts to make decisions concerning the use or inclusion of new and innovative methods. These studies are extensive and require strict research procedures and methodologies.

Among our major efforts in this area was a study, the major purpose of which was to compare two methods of teaching advanced shorthand with the ability to transcribe shorthand notes. May I say here that we believed this study to be imperative because of the basic nature of shorthand as a skill in office occupations. Since our study met the criteria of a true experimental design, and our results were so significant, I should like to take a few moments to describe it to you.

Since 1963, the Philadelphia School District has been installing laboratories for use in advanced shorthand classes in selected high schools throughout the city. These labs have been designed to accomodate programmed tapes of materials, both from original sources as well as from standard texts which are used in schools where both the lab and traditional methods are used. While the intrinsic values of laboratory techniques are evident, research was necessary to determine differences in achievement between the laboratory and traditional methods of instruction. By

accident, it was found that these labs had been installed in about half of the high schools in the city. As a further check, however, we compared the intelligence of the students using the labs with those who didn't, in order to be certain that our results were due to the type of instruction given and not to higher ability of one group over the other. From the results of this study it was found that the students who learned advanced shorthand by the laboratory method achieved significantly higher scores than did those students who were taught by the traditional method. Thus, it can be seen that the application of a technique long used in the teaching of foreign languages has excellent promise in the area of business education.

Another project which we are just beginning to get involved in deals with a comparison of techniques for the instruction of bookkeeping. Although it must be considered only a pilot project, this effort has two interesting aspects. First, the comparison involves a traditional versus a simulated method of supplying source document information. In the traditional approach, this information is contained in text book narratives. Whatever realistic aspects are present in this method are due to either textbook figures showing examples of business forms or problem sets included as culminatihg exercises. In the simulated source document method, a wide variety of sample forms are used to provide information for bookkeeping students. This information is entered into the customary journals. It is anticipated that students receiving the more realistic bookkeeping instruction will not only have a better understanding of bookkeeping principles but will be able to put these principles into a wider range of practical situations.

The second interesting aspect of this project involves the method of evaluation. Two examinations will be given to both the traditionally taught and specially taught groups of classes. Both of these examinations will cover the required material but one will test in the conventional manner while the other will use the source document technique to present material. Each test will test for

competencies in two areas: computational accuracy and journal entry placement accuracy. In this way both groups of classes have an opportunity to show what they learned under their method of instruction.

Since more than one dependent variable is being used in this evaluation, two courses of action are available. First, separate t tests may be used for each dependent measure. However, this has problems. Statistically speaking, the probability distributions of several dependent measures are not independent (i.e. they are correlated), and the error components of each tend to confound any inferences we may make. In the second technique, multivariate analysis of variance, correlations of measures are taken into account and we can make inferential statements concerning the joint probability distribution of our variates. Consequently, we will use multivariate statistical approaches in the examination of our data.

Last, I should like to take a few moments to discuss some plans for the future. As industry changes its requirements, as new jobs are being created, the schools if they are to progress must add courses, change long range objectives, modify short term objectives and generally, remain current. Within a short period of time, our Division will begin to expand its function to include an ongoing Research Development function. Instead of the current one-shot or single limited time research projects so necessary as a beginning step, its role and responsibility will be expanded to include longitudinal studies involving curriculum development, alternative ways of testing curriculum objectives, revisions and retesting functions. In a world changing so constantly, this is the only type of research which does not date itself. Another factor also which must be mentioned is the role research must play in helping business education help itself. Not only must we assist in defining objectives in behavioral terms to see perhaps more clearly where business education is going, but we must also help develop the tools which are necessary to evaluate the programs.

Research is costly, and efforts must be spent where the need is greatest. Because manpower and money is scare, priorities must be set but this does not mean nor should it imply a neglect of the less pressing concerns. Research personnel can and should play an educative role in helping business supervisors, particularly those who work with the grass roots level, develop competencies which they can apply on perhaps a limited basis. If you think I believe the researcher has some magic formula up his sleeve which he can dispense like some pill, I don't. I am firmly convinced, however, that the researcher and curriculum specialist can learn a great deal from each other. Like a good marriage each has a contribution which will not only ease the burden of the other, but can, working together, achieve a much greater degree of success than would have been possible working apart.

THEME: Its a changing world. . . . . In business Education

TOPIC: A new pattern is developing for in-school programs.

SPEAKER: Garth A. Hanson, Assistant Professor, Business Education, Logan, U tah
Utah State University

Simulation began in Utah in 1965 when lo teachers met together in a one week workshop at Utah State University. Their purpose was to develop a guide for teachers in Utah to use in conducting simulated office programs. The need for simulation arose due to 2 basic reasons.

1. There were 25 so-called Co-operative office education programs in the state. Only 5 or 6 of these were close to the correct concept. Many of the programs were conducted in areas not really suitable for the Co-op program.
2. Teachers were rebelling against pressures from state specialists to establish co-op programs. They either:
    1. Did not want to leave the classroom for the co-op program.
    2. Did not want to spend the extra time co-ordinating the co-op program
    3. Felt they did not have a large enough community to support the program.

In an effort to correct some of these problems, simulation became a method of teaching in Utah. After the 1965 workshop, only one teacher really got a simulation off the ground. This teacher taught a conventional office practice program during the first three-quarters of the school year during which time she prepared letters, invoices and other office input material. Then, during the last quarter of the year, she re-arrange the room and conducted the simulation.

The next three years were spent in finding better ways of conducting simulations. Finally, the Mobile Office Education (MOE) laboratory was established to servefour

rural high schools in the state. During the summer this unit was used to teach the children of migrant farm workers in a local farm worker camp.

On the strength of these experiences, Utah State University at Logan, U tah submitted a proposal to the U. S. Office of Education entitled "Practicum for Simulated Methods in Office Ocuppations Education. The proposal was funded and 36 participants and 3 observers were brought to Logan during July, 1968 to learn more about Simulation. The Practicum Participants were introduced to three applications of Simulation

1. Mobile Office Education - MOE had two basic objectives. One was to test the use of a mobile laboratory in its different applications. The second was to test Simulation as amethod of teaching. The participants were given the opportunity to work in MOE and see how it functioned.
2. R ich Man's offic e - An office was constructed in the Practicum facility to show how a simulation would be set up if money was no major problem. The set-up included a telephone system, office style furniture, and the latest of office equipment.
3. Poor Man's Office - Simulation is not completely dependent upon equipment and it can be carried on in an office education classroom equipped only with typewriters and tables. In this case however, a telephone system needs to be added as quickly as possible.

Procedures of Simulation were discussed at length and the participants went to work developing their own simulations. The Practicum was a huge success and the ramifications have been felt country-wide.

FOUR REASONS FOR HAVING A COOPERATIVE PROGRAM

by Maxine Emery[1]

1. To secure a better opportunity or related experiences for your students

2. To secure a close curriculum training tie-in

3. To get better production out of our students

4. To establish a system to discover "hidden talents" that exist in our students

[1] Consultant, Vocational Office Education, Texas Education Agency, Corpus Christi, Texas.

FIVE PHASES OF SELECTING AND DEVELOPING TRAINING STATIONS

I - Designation

Inform: - Administration and Faculty
Management
Students
Civic Groups

II - Class Organization

Do: - Enroll
Teach-Train
Correlation of Materials with Jobs

III - Job Training

The Program
How to Supervise
How to Train
How to Correlate Job Training with Classroom Learnings

IV - Coordination

Visitation
Coordinating Employer's Suggestions with Classroom Instruction

V - Individual Visits

Visits
Application
Handling
Problems

The teacher-coordinator should have knowledge of the type of skills her students may offer employers and then try to match the training station with the student's specific skills and career objectives.

The selection of training stations are carefully selected by the following objectives:

1. Type of training the student will receive
2. Meeting moral and ethical qualifications
3. Pay
4. Hours
5. Mutual understanding and agreements among the employer, the school, the teacher and the prospective student-learner

The training station must serve primarily as a training medium - rather than merely as an opportunity for remunerative employment for the student or for an employer to obtain part-time help.

The experience should be towards the development of knowledge, skills and attitudes needed for the occupation for which the individual's training program is designed and which fits his career objectives.

WHERE TO GO TO LOOK FOR TRAINING STATIONS? ?

1. Personal contact with prospective employers
2. Telephone (although personal contact seems to be more worthwhile)
3. News media
4. Civic clubs
5. Other faculty members and administration
6. Other vocational teacher-coordinators
7. Contact former employers

There are several places of employment that cannot be considered an applicable training station because of the environment being dangerous to the students' health or morals. Many places also demand that a student be at least eighteen years of age.

The selection of training stations should be carefully selected by the following guideposts:

1. Is the job commensurate with the students ability and career objectives?

2. The nature of the work and the type of training the student will receive.

   . Activities, duties and responsibilities?

   . Occupational intent matched with job?

3. Mental Requirements

   . Verbal comprehension

   . Reasoning

   . Numbers ability

4. Personality Requirement

   Will the job require the student to be:

   . Sociable

   . Energetic

   . Persuasive

   . Careful about details

   . Persistent

5. Educational and Training Requirements

   . Skills necessary

   . Level of training necessary

   . In-service training on job? What type?

   . Length of training on job?

   . Salary?

6. Entrance into the job

   . Any formal examination required?

   . Who conducts the examination

   . Are there costs entailed in taking the examination

7. Possible restrictions

   . Age

   . Men only, women only

   . Race or nationality

   . Physical handicaps

   . Background dangerous to student's ethics or morals?

   . Personal appearance

8. Working conditions

   . Hours of work

   . Regular or irregular hours

   . Is there any overtime? Are there busy seasons when the work is particularly heavy?

   . What kind of machines are used

   . Does the job involve a rush and a continuous working against time? Tension?

   . Is there a required output per unit of time?

9. Is the work highly routine in nature?

DEVELOPING THE TRAINING STATION

Just as the coordinator has definite responsibilities in teaching his students, so does the on-the-job training sponsor have definite responsibilities in teaching his student-trainee. The employer might be referred to as the "downtown teacher."

A. What teaching responsibilities does the "downtown teacher" have?

1. Understand the goal of the training program
2. Know units being studied in the classroom
3. Know enough about student-trainee to be able to teach him effectively
4. Work in partnership with coordinator
5. Give accurate information about the student-trainee to the coordinator
6. Take time to be a teacher
7. Provide "learning by doing" experiences
8. Give support to the Club program
9. Teach specific job skills
10. Teach "values" in human relations
11. Teach technical information
12. Teach business ethics, responsibility
13. Teach policies, systems, methods of training agency
14. Help student develop judgment and a mature outlook

B. How can we help the "downtown teacher" carry out his teaching responsibilities?

1. Develop a plan to follow in training the employer or supervisor

2. Keep the employer's training needs in mind during all coordination activities

3. Show Co-op Program film

4. Review unit content throughout the year

5. Develop projects in relation to job and class discussions

6. Give personal data on the student-trainee with discretion

7. Interpret school policies

   a. Calendar (vacations, schedules, events)
   b. Regulations

8. Suggest experiences student is ready for in the training agency

   a. Give student an opportunity to learn by doing
   b. Find ways for student to develop in the job assignments

9. Suggest evidences of progress to look for in student's performance

10. Analyze the job in terms of the student's needs for training

    a. Skills
    b. Technical information
    c. Systems, regulations, policies of the companies
    d. Physical requirements

11. Suggest additional training directed towards promotional opportunities

SUMMARY

WHAT DOES IT ALL ACCOMPLISH?

In a speech of this type, we can only touch briefly on some of the more obvious features of cooperative office programs. As time goes on, its ramifications and advantages will become more and more evident.

But even on the basis of what we know now, it is clear that, along with the other ideas of the business education curriculum, cooperative office education will be held together in a tight network that will bear little resemblance to anything that we have known before.

Great days are ahead for business educators who are not afraid of the vocational label. The opportunity is there; the challenge is there; and the responsibility is there, too. Can we share in the crusade to eliminate poverty in the midst of prosperity?

People in our field have said that we could solve many of the problems of our economy if only we were given the right tools. The funds from the Vocational Education Act of 1963 is holding out the tools and telling us to take them if we want them.

*VOCATIONAL ADJUSTMENT; *EDUCATIONAL RESEARCH; *YOUNG ADULTS; *VOCATIONAL COUNSELING; *SPEECHES; VOCATIONAL DEVELOPMENT; VOCATIONAL EDUCATION; COUNSELOR PERFORMANCE; RESEARCH REVIEWS (PUBLICATIONS); ROLE PERCEPTION; YOUTH; YOUTH EMPLOYMENT; EMPLOYMENT PROBLEMS
*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968

"A Transition from School to Work, An Interim Report of Research Findings" by Robert E. Campbell describes seven studies related to the adjustment problems of young workers. The four studies which are completed are: (1) an annotated survey of the literature on the transition from school to work, (2) problems in the transition from high school to work as perceived by vocational educators, (3) problems in the transition from school to work as perceived by youth opportunity center counselors: a national survey, and (4) changing the responses of vocational students to supervision. The last three of these are described in detail. Three studies still in progress are: (1) experimental attempts to improve the adjustment of vocational trainees to supervision, (2) a survey of worker adjustment problems as perceived by youth on the job, and (3) applications of role theory to occupational choice and adjustment. "The Things-Data-People Vocational Counseling Interview" by Sidney A. Fine, describes the total performance counseling interview, one by which a counselor can explore those activities and decisions in a person's life which form the basic background for input for his ultimate choices and adaptations. THE TRANSITION FROM SCHOOL TO WORK

AN INTERIM REPORT OF RESEARCH FINDINGS*

Robert E. Campbell
The Center for Vocational and Technical Education
The Ohio State University

Although only four per cent of the American labor force is presently unemployed, job opportunities are not evenly distributed throughout the social structure. The youthful worker composes one group which is disproportionately represented among the "structurally unemployed." In recent years, the 14 to 19, and 20 to 24 age groups have ranked first and second respectively, as having the highest rates of unemployment. Combined, these two age categories have an unemployment rate two to three times higher than the national average (U. S. Department of Labor, 1968). Thus, it is not surprising that this problem has become of national concern.

These high unemployment rates document the fact that many youth are experiencing considerable difficulty making the transition from school to work. Unemployment rates of youth represent a fairly reliable indicator of the extensiveness of the problem on which this research is focused, namely, the adjustment problems of young workers. As one of its research thrusts, The Center for Vocational and Technical Education at The Ohio State University is engaged in a series of studies on the transition from school to work. The overall project has three primary objectives as follows:

---

* Presented at the Annual Meeting of the American Vocational Association, Dallas, Texas, December 11, 1968.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

1. To identify the major socio-psychological problems facing youth (16-25 years old) making the transition from school to work.
2. To develop and test solutions which will be instrumental in alleviating some of the most crucial worker adjustment problems.
3. To encourage the adoption of new instructional materials by vocational programs and the adoption of other programmatic solutions which will facilitate worker adjustment.

The purpose of this presentation is to give an interim report of the status of our research efforts. Thus far, we have initiated 7 studies on this problem and most of these have focused on objectives one and two, i.e., identification of major problems and developing solutions. Four of the seven studies are completed and three are in progress. The seven are as follows:

1. An annotated survey of the literature on the transition from school to work. (Completed)
2. Problems in the transition from high school to work as perceived by vocational educators. (Completed)
3. Problems in the transition from school to work as perceived by youth opportunity center counselors: a national survey. (Completed)
4. Changing the responses of vocational students to supervision. (Completed)
5. Experimental attempts to improve the adjustment of vocational trainees to supervision. (In progress)
6. A survey of worker adjustment problems as perceived by youth on the job. (In progress)

7. Applications of role theory to occupational choice and adjustment. (In progress)

I would like to devote the remainder of my presentation to the findings of our 3 completed studies in this series. The first of these was a study of the problems in the transition from high school to work as perceived by vocational educators. The objectives of this particular exploratory study were to survey vocational educators on three major questions (1) the identification of major problems faced by youth in the transition from school to work; (2) to compile a list of curriculum materials, teaching aides and the like currently being used by vocational educators which are considered to have some potential for alleviating major transitional impediments; and (3) obtain suggestions or recommendations concerning what is needed, e.g., curriculum materials, programs, and teaching aids which would facilitate the school to work transition.

Three major criteria were used in the selection of respondents. First, the vocational educators were selected from a variety of places throughout the country since it is likely that adjustment problems differ from one area of the country to another. Second, only urban communities were sampled. Exclusion of rural areas was based on the rationale that most youth are presently working, or will be employed, in urban communities. Third, it was desired that the sample of vocational educators have considerable insight into young worker adjustment problems. Consequently, only those subjects were selected who met various criteria which suggested they should have considerable knowledge of problems relating to the adjustment of young workers.

Within each of the major Census regions of the United States, specific urban localities were identified which tended to be characterized by certain demographic, economic, and socio-cultural factors, considered to be possible contributors to the problem of young worker adjustment in the area. These factors included: (1) high unemployment; (2) high outward migration; (3) high inward migration; (4) limited industrialization; (5) racial-ethnic problems; and (6) low educational investment.

Five primary characteristics were sought in respondents: (1) at least two years of experience as a vocational educator; (2) realistic exposure to the world of work, close liaison with industry, and maintenance of both informal and formal follow-up data on graduates; (3) innovative-dynamic and dedicated to his job; (4) considerable insight into problems related to young worker adjustment; and (5) collectively, the sample should constitute a balanced distribution of positions in the educational structure.

Twenty-two cities representing considerable population and geographic diversity provided a total of 69 respondents. The respondents were selected by directors of vocational education in accordance with the 5 criteria specified above. Most of the respondents were teacher coordinators and encompassed the full range of vocational education specialties. Each respondent was interviewed for approximately two hours by a trained interviewer. A structured interview schedule was developed specifically for this task which provided a standardized interview format for all respondents.

The vocational educators enumerated 49 specific worker adjustment problems which were subsumed under 12 broad headings. The first 6 of

these broad categories relate primarily to the young worker, both as an individual and product of his socio-cultural experiences; they include his personal characteristics, attitudes, preparation for work, behavior, family background, and military status. The next two categories include factors inherent in the high schools attended by the youths, e.g., inadequate curriculum, teaching, and guidance services. The next three categories cite factors inherent in the communities in which the youngsters lived and in the job situations they entered. The final category includes conditions falling outside the three major groupings.

Of the 12 broad worker adjustment categories, 5 were listed by the majority of the respondents. Problems in job preparation, e.g., lack of experience, unrealistic job expectations, and lack of basic job skills were most frequently mentioned by 85 per cent of the respondents. The next three most frequently mentioned categories related to negative attitudes and personal habits on the job, e.g., immaturity, irresponsibility, absenteeism, poor work habits, and inability to follow directions. The fifth dealt with inadequacies in school programs and services.

The second objective of the survey asked vocational educators to describe teaching materials which they have used to alleviate worker adjustment problems. The information offered by the respondents provided only an incomplete and sparse list of materials and methods. Lecturing was the most prevalent teaching method used for presenting students with a general picture of the world of work. Field trips, visiting speakers, and personal conferences with the students and/or employers were also cited as popular methods.

The third and final objective of the survey sought suggestions for the development of teaching and curriculum innovations to facilitate the transition from school to work. The numerous suggestions were classified into 5 major clusters as follows:

1. The development of books, pamphlets, and booklets.
2. The preparation of audio-visual materials.
3. The development of services and facilities. For example, a centralized placement service within the school; provide a vocational-technical education library within the school; and the use of local advisory committees.
4. Improvement of programs and curriculum. For example, simulated work experiences, a course on labor economics, and sequenced courses on career information beginning in junior high and extending through senior high.
5. The development of projects, kits, and tests. For example, student fact finding studies of local businesses, pre-employment readiness tests, and career books written by students.

The second study is entitled the "Problems in the transition from school to work as perceived by youth opportunity center counselors: a national survey." The objectives and procedure are basically the same as the vocational educators' survey except that it looks at the problems in the transition from school to work from a different perspective, i.e., that of the Youth Opportunity Center counselor. The YOC counselor is in a unique position to observe transition problems in that the YOC's major focus is to provide vocational guidance to youth planning to enter the labor force. At the time of this survey (fall, 1967) there were 167 YOC's in operation.

YOC's are restricted primarily to urban areas and their client population is not representative of the total youth population. It is probably safe to say that the average YOC counselor is serving a client population of urban youth of below-average educational attainment with an above-average number of occupational problems and is increasingly concerned with affecting change in his clientele or in the environment of his clientele rather than just finding jobs for them.

Questionnaires were sent to all 167 Youth Opportunity Centers. The questionnaire had four major sections and was basically the same as the one used in the vocational educator's survey previously described. The first section asked each respondent to indicate what he saw as the major problems facing youth in the transition from school to work. The second section asked the respondent to list the kinds of things the schools could do to enhance the adjustment of youngsters to the world of work. The third section asked the respondent to list materials useful in dealing with the problems identified in section one. Finally, the fourth section requested respondent background information.

Completed questionnaires were returned from 48 states and 150 of the 167 YOC's. The return represented 763 completed counselor questionnaires and constituted an estimated 59 per cent of the total population of YOC counselors. Due to limited time, I will not present the detailed data describing the characteristics of YOC counselors. This data is available and can be obtained from our final report.

The 763 YOC counselors identified 50 problem categories which were subsumed under 9 broad problem clusters. The 9 problem clusters varied as to the frequency with which they were listed by the counselors ranging from

a high of 86 per cent to a low of 6 per cent. In order of decreasing frequency of mention, the 9 clusters are as follows: (1) Inadequate job preparation and knowledge of the world of work (mentioned most frequently); (2) personality variables (primarily attitudinal and personal expectancy problems; (3) vocational behavior (e.g., inability to accept supervision, and poor work habits); (4) deficiencies in school programs; (5) discriminatory factors (e.g., racial, ethnic, and child labor laws); (6) family background (e.g., cultural deprivation and parental pressures); (7) community factors (e.g., lack of job opportunities, and training opportunities); (8) factors inherent in job (e.g., job requirements in excess of what is needed, and the impersonality of large organizations; and finally (9) military obligation.

In response to the second section of the questionnaire, asking the counselors to suggest things the schools could do to enhance the adjustment of youth in transition, the counselors offered 28 suggestions which were classified into 3 broad clusters. The first cluster suggested by 81 per cent of the counselors dealt with improved guidance services. This cluster included such suggestions as the provision of better occupational information, increased cooperation between the school and the employment service, and specialized counselors for non-college bound youth. The second cluster involved suggestions for improved vocational education. Teaching pre-vocational skills, i.e., worker adjustment skills, upgrading of vocational programs, and more cooperative training were examples of the suggestions most frequently mentioned in this cluster. The third cluster offered suggestions for improving general education. Better preparation in the basic courses and individualized instruction were recommended.

The third section of the questionnaire asked the counselors to list materials useful in dealing with the problems in the transition from school to work. The counselors listed approximately 100 titles of books, pamphlets, and films. Time does not permit reciting the 100 titles, but suffice it to say that the 100 titles represent the traditional occupational information materials such as references for the counselor on how to counsel, the nature of adolescence, and measurement; and references for the counselee, e.g., films and literature. Although the list of titles was traditionally comprehensive, it was disappointing in that we were hoping to identify innovative techniques in helping students in this transition period, but unfortunately few were identified.

The final finding of this second study compared the list of problems identified by the YOC counselors with the list compiled by the vocational educators in the first study. The comparison was accomplished by rank ordering the problems by frequency of mention for both groups. The problems were ranked by specific problems and not by broad clusters. The two samples had moderate similarity in the relative frequency of problems listed; the rank order correlation was .61. Larger percentages of YOC counselors than vocational educators mentioned inadequate training, lack of job skills, and lack of information about work and job opportunities as being problems; whereas, vocational educators mentioned non-skill related problems (e.g., work attitudes and coping with the demands of work,) and academic overemphasis in the schools more frequently. Most of the notable differences between the two samples can probably be attributed to the different populations of youth with whom the respondents have worked. The vocational educators have probably worked with youth who are in the latter years of high school, have chosen a field of training and are receiving skill

training whereas, YOC counselors typically are serving youth who are dropouts or graduates of general academic programs and are deficient in job skill attainment.

The third study I would like to discuss is entitled "Changing the response of vocational students to supervision: the use of motion pictures and group discussion." This study focused on a specific worker adjustment problem and represents an attempt to facilitate worker adjustment as it pertains to subordinate-supervisory relationships. Our exploratory surveys emphasized the importance of satisfactory subordinate-supervisory relationships as a critical key to making the transition from school to work. In most instances, youth have difficulty accepting supervision, e.g., being told what to do by the boss, accepting criticism, and following orders. The purpose of this study was to determine whether viewing and discussing five movies, each depicting a different pattern of supervisory behavior, will enable maladjusted students to react more favorably to supervision.

Scenarios were prepared and movies produced to depict the following patterns of supervisory behavior: Consideration of Employees, Structuring Expectations, Tolerance of Freedom of Action, Production Emphasis, and Speaking as Representative of the Group. The movies were shown to small groups composed equally of well adjusted and poorly adjusted students, as determined by teachers' ratings. After seeing the movies, the students engaged in free discussion without any attempt by the researchers to influence students attitude toward the supervisory role being discussed. Some groups expressed favorable attitudes, while others expressed unfavorable attitudes, toward the same role. Approximately eight weeks after discussing the movies, the students were again rated by their teachers on adjustment to supervision.

Poorly adjusted boys who discussed the movies in three different schools gained more in ratings of adjustment to supervision than did the poorly adjusted control groups who did not see the movies. The differences were not statistically significant. Poorly adjusted girls in one school only were rated lower in adjustment to supervision after seeing the movies than before. However, the control group of girls lost more in adjustment ratings than did their control group. All well adjusted groups were rated lower on the second rating than on the first as a result of a tendency by the teachers to adjust their second ratings downward. However, the experimental groups of boys lost less than the control groups.

All poorly adjusted experimental groups of boys gained more in adjustment to supervision than did the control groups. All well adjusted experimental groups of boys lost less than did the control groups of well adjusted boys. The experimental group of poorly adjusted girls lost less than their control group, but the reverse was true for well adjusted girls. The results for all groups, except well adjusted girls, favor the experimental groups that saw and discussed the movies. It is concluded that the above results justify further use of the movies in training and research.

In summary The Center is engaged in a series of studies focusing on the identification and amelioration of the problems of youth in the transition from school to work. We have initiated 7 studies on this problem, four of which are completed and three are in progress. I have reported on three of the completed studies; two of these were exploratory surveys sampling vocational educators and Youth Opportunity Center counselors about the kinds of problems encountered by youth as they enter the world of work. Both sample groups listed similar problems such as inadequate job preparation, worker attitudes, and on the job adjustment difficulties. Differences between the two groups of respondents were attributed to the differences in the youth populations they serve; the YOC counselors more frequently work with school dropouts and graduates of general academic programs who possess no clearcut marketable job skills.

The third study represented an attempt to alleviate a particular on the job worker adjustment problem that of adjustment to supervision. Five films were developed depicting 5 different supervisory styles. The films were used in association with group discussion to train vocational trainees to understand different supervisory styles which might result in improved subordinate-supervisory relationships. The pilot test of this approach indicated that the film-discussion technique can produce adjustment improvements. Further testing of this approach is in progress.

In conclusion, I believe that the studies I have reviewed suggest that there is much to be done to facilitate the transition from school to work. Although it is clear that youth especially non-college bound youth must have marketable job skills to successfully survive in the labor market, it is equally clear that youth also need non-technical skills to achieve a successful transition. We need to expand our course offerings to include training in the non-technical aspects of work as well as the technical aspects.

THE THINGS-DATA-PEOPLE VOCATIONAL COUNSELING INTERVIEW

The big problem we have in vocational counseling is that, even though we go far beyond the securing of quantitative data (refuting what many critics have to say on that score), even though we acquire the most detailed and comprehensive information about the individual, our dilemma remains -- what do we do with it? How do we help the client to make use of it? How do we establish the relevance of so much data? How do we aid the counselee in organizing his thinking about himself and assessing the relative significance of the facts about himself that we array? How do we finally help him to solve his problem of occupational choice and the pursuit of opportunities in the world of work so that they are in line with his self-concept?

What we need is a "transformation formula" whereby we can start with people as they are at a given time, whatever their level of life experience, and help them to discover the main trends in their lives which may be significant for vocational adjustment. Such a "transformation formula" can help us as counselors to develop the skill, capacity, perception -- call it what you will -- to detect those major themes in work and nonwork experience which characterize a given life.

The Things-Data-People or total performance counseling interview that I have structured is one by which a counselor can explore

those activities and decisions in a person's life which form the basic background or input for his ultimate choices and adaptations.

The Things-Data-People concept is little dependent upon verbal and other symbolic skills for understanding. Any person, at any stage of his development, can take a good hard look at himself and reflect upon the choices he has made in terms of things, data, and people all his life. In thousands of little ways, consciously and unconsciously, all individuals have had experience in making choices which are essentially Things-Data-People choices. Through the Things-Data-People interview, the counselee can explore his reactions to daily experiences and activities and project them with the help of the counselor onto the screen of occupational significance. This can help him to express his aspirations and also to get a realistic picture of how he feels about himself in relation to the world of work. A relatively inarticulate counselee can find significant identity in the Things-Data-People aspects of his experience.

In this interview, vocational ability is conceived in terms of adaptive, functional, and specific content skills. But there is more to occupational life than the skills which the worker has to offer -- there is also what the work brings to him in terms of satisfaction and fulfillment.

The client is encouraged to explore himself in terms of his characteristic pattern of adapting, such as how he feels about relating to authority figures, accepting tedium in a job, relating to a group, coping with many things at once, and being accommodating toward people. He is led to think about how he has responded to

his opportunities for discretionary tasks as contrasted with prescribed tasks and to assess his functional skills such as compiling data, doing precise work with things, or supervising people.

Finally, as the counselee begins to more clearly visualize himself in answer to the question, "Who am I?", specific content possibilities which go with the kinds of work he is considering are brought to the fore and mutually explored.

In this type of interview, the counselor acts as a sort of radar that beams back to the counselee interpretations of the meaning of the client's experiences. The counselor can do this on the basis of a course of study that has translated what goes on in the world of work into terms of Things, Data, and People, the various type of skills involved in successful work adjustment, and his understanding of his own life in these terms.

Outline of the Things-Data-People

Vocational Counseling Interview

1. **Objective**

To provide the counselor with a frame of reference eliciting information from the counselee that has immediate and direct applicability to information relevant to the world of work.

More specifically, to enable the counselor to work toward a formula which transforms the percepts of the counselee's experience to the concepts that are significant for vocational choice.

2. **Figure and Ground in Job Perception**

3. Method

a. Counselee is given a brief description of method. Image: Projection of self on a screen such as an oscilloscope.

b. Probes are made.

(1) Three probes into educational experience: "How would you describe yourself as a person in terms of Things-Data-People?" The counselee is asked to answer the above question in relation to three significant points in his individual development. Assuming the counselee has a school background, the times would be as follows: for a 17-year-old, 5th grade (age 11), 8th grade (age 14), and 11th grade (age 17); for a 24-year-old or older, 7th grade (age 13), 11th grade (age 17), and college junior (age 21). If the counselee lacks a formal schooling background, the inquiry is addressed in terms of age alone.

(2) Three probes into work experience:

(a) "What work or tasks have you liked least?" Describe in terms of Things-Data-People. Explore in terms of frame of reference.

(b) "What work or tasks have you liked best?" Describe in terms of Things-Data-People. Explore.

(c) "In the same terms of Things-Data-People, how would you describe what would be an ideal job now?" Explore.

4. Derived Measures

a. Orientation - Relative preference for Things, Data, or People.

b. Level - Indicated experience and capability to function adequately at one or another degree of complexity.

c. Structure - Indicated combination of prescribed and discretionary instructions for optimum functioning.

d. Style - Conditions under which adaptive skills engage specific content requirements for optimum functional performance (physical demands, time, temperament, size of organization, etc.).

USING PROJECT TALENT TO IMPROVE VOCATIONAL GUIDANCE

G. Brian Jones

Guidance Research Program

American Institutes for Research

This paper is based on a project currently being conducted pursuant to a contract with the Office of Education, U.S. Department of Health, Education, and Welfare, (Contract No. OEG-0-8-070109-3530 (085), Research Project #7-0109).

Presented at the 62nd Annual American Vocational Association Convention, Dallas, Texas--December 10, 1968.

During recent months we have been giving some thought to a guidance-related problem brought to our attention by vocational educators at an area vocational center. This is a problem of assisting students to consider vocational-educational opportunities if these represent viable decision-making alternatives for them. A pilot investigation led us to conclude that to meet the needs of prospective vocational education students a guidance system must help these students in educational and vocational planning, interest them in the exploration of the training opportunities for skilled trades, and motivate them to seek information and perhaps pursue enrollment in the vocational-educational opportunities offered at such institutions.

Vocational counselors often find that there are at least three inter-related factors adversely affecting student interest in vocational education. First, vocational education programs are considered as a "dumping ground" for many school systems (Snedden, 1938, Passow, 1968). Students unable to meet the demands of college preparatory or general education curricula are often "counseled" toward vocational education curricula (Conant, 1961). Second, many parents, teachers, and school administrators not directly involved in vocational education programs consider them "less respectable" than college preparatory programs (Wenrich & Crowley, 1964). Third, students themselves frequently develop pejorative attitudes--probably conditioned by their parents and other adult models--toward vocational education teaching, and toward the students and the values of terminal training programs (Silverman, 1963).

Our recommendation to the vocational educators concerned is that a well-developed comprehensive vocational guidance system, aimed not only at assisting students to formulate their educational and vocational goals, to plan the achievement of these goals, and to manage their performance toward these goals, but also at involving parents in these processes, can be a necessary condition for countering negative attitudes toward vocational education. This paper

briefly outlines possible components of such a guidance system and indicates how the findings of Project TALENT can contribute to the improvement of some of these components.

A Comprehensive Vocational Guidance System

A grant to Dr. John C. Flanagan by the Division of Comprehensive and Vocational Education Research of the U.S. Office of Education is enabling us to capitalize on the Project TALENT data in order to develop a comprehensive guidance system. We are attempting to concentrate on the type of system which would be an integral part of a program of individualized education such as that visualized by Morgan and Bushnell (1966) in their proposal for designing an "organic curriculum."

To be comprehensive such a guidance system must serve the needs of all students. By integrating it closely with the basic instructional system at all academic levels, educators will be able to assist each student to acquire necessary personal information, information about life opportunities available to him or her, prerequisite problem solving skills in planning, decision making and management so that each one will be helped to formulate and pursue appropriate goals. Within such a framework, guidance becomes "the professional use of a science of purposeful action within a specific structure of education (Tiedeman and Field, 1962, p. 483)." Included also are assumptions that students are capable of learning how to contribute to planning their careers and should be involved in making decisions which influence their destinies.

A second way in which such a guidance system must be comprehensive is that it must complement the other activities of the educational program in which it functions so that the total program attempts to meet all the needs of all students. By labelling this system as "vocational guidance" while defining it as a system which seeks only to help students select an appropriate vocation, we would be limiting its comprehensiveness. To avoid any such restriction perhaps

we should follow Katz's (1968) suggestion and label it as "career guidance" instead. His paper prepared for the National Vocational Guidance Association's "Reconceptualization Project" indicates that he believes the word "career" incorporates all possible patterns of choice at any given point in time and refers to the totality of life style. Lewis (1968) suggests that the term vocational guidance is much preferred by those who see the function of guidance as being the efficient allocation of the nation's human resources. On the other hand, the advocates of guidance, without the modifier "vocational", view its function as involving the provision of any assistance necessary for helping each student develop his potential.

By focusing on students' needs in order to help us specify the system's objectives and evaluative criteria, we are attempting to use a systems approach to the design, development, and evaluation of this comprehensive guidance system. To identify general groupings or clusters among the student needs, our preliminary investigation has included review of existing guidance programs and of the professional literature--including follow-up studies of school graduates and dropouts--as well as observation of the decisions faced by students currently enrolled in individualized and regular instructional programs. We are postulating on the basis of this investigation that a comprehensive guidance system must contain the 12 components listed below.

1. Orientation-in.

   Goal: for each student to acquire the various kinds of information, understandings, overt behaviors, and attitudes they need in order to function successfully both in a new educational system and in the specific school setting in which that system operates.

2. Personal assessment.

   Goal: for each student to know and understand the status of his development with respect to abilities, interests, physical and social characteristics and values in the areas of education, vocations, social behaviors, citizenship, learning behaviors, and use of leisure time.

3. Personal choice opportunities.

Goal: for each student to know and understand the variety of opportunities available for personal involvement. The six areas for consideration encompass vocational, educational, citizenship, leisure-cultural-recreational, learning, and social opportunities.

4. Personal problem solving skills.

Goal: for each student to develop and use skills which enable him to solve problems by making decisions and plans wisely and implementing these.

5. Personal problem solving.

Goal: for each student to make and implement personal decisions and plans by integrating the knowledge and skills achieved in guidance components 1 through 4, Important here are experiences which enable students to formulate their goals and their plans for meeting these goals. Students must be aided to relate the instructional objectives in their programs of studies to their long-range goals. As students manage their performance toward these immediate and long-range goals, the continuous progress characteristic of individualized education is attained.

6. Prescribed learning experiences.

Goal: for each student to have assistance to resolve specific learning, intrapersonal, and interpersonal problems which are impeding his or her current progress and development. The number of such learning experiences is manifold. Examples are activities for behavior assessment and modification as well as for providing information on specific jobs, schools, courses, etc.

7. Orientation-out.

Goal: for each student to acquire the various kinds of information, understandings, overt behaviors, and attitudes they need in order to function effectively when they exit from an educational system or a specific school setting. Student needs here will vary, dependent upon what they anticipate doing after they terminate--e.g., entering the world of work, attending an institution of higher education, dropping out without specific plans, having a family, enlisting in the military.

8. Monitoring and possible modification of aspects of the educational system.

Goal: to provide assistance from adults and technology so that each student in that system will be able to formulate and to progress toward agreed-upon goals.

9. Monitoring and possible modification of school personnel.

Goal: to provide assistance from adults and technology so that communication with, and possible in-service training of, school personnel will be maintained so that each student will be able to formulate and to progress toward agreed-upon goals.

10. Monitoring and possible modification of home and neighborhood factors.

Goal: to provide assistance from adults and technology so that communication with, and possible learning activities for, parents will be maintained so that each student will be able to formulate and to progress toward agreed-upon goals.

11. Monitoring and possible modification of community resources.

Goal: to communicate with community representatives (e.g., health, social, and welfare agencies; businesses and industries) so that each student will be able to formulate and to progress toward agreed-upon goals.

12. Research and evaluation.

Goal: to conduct experimentally-controlled studies for the evaluation of guidance and counseling techniques and procedures, follow-up studies of graduates and dropouts, analyses of changes in the characteristics of the student body so that each student will be provided with up-to-date, evidence-supported information and assistance.

We are attempting to compile a body of techniques and procedures which can be used to implement these possible components of a comprehensive guidance system. Teaching learning units, counseling personnel contact with individual students or with groups of students, computer monitoring, or on-line computer assistance are some of the available techniques. We hope to be able to integrate, and evaluate the effectiveness of, some of the currently available techniques and procedures related to each component. Where ones are not available we anticipate doing some developmental work not to exhaust the range of possible strategies but to provide ones which will permit experimental comparisons of the relative effectiveness of a few alternate strategies. Such experimentation necessitates the development and refinement of criterion instruments related to the behavioral objectives and student outcomes outlined for each system component.

Examples of Project TALENT Implications

The Project TALENT data bank of information collected from schools and students regarding student characteristics, educational experiences, and subsequent activities is facilitating analyses which suggest improvement in educational policies and practices and in guidance programs. In addition TALENT data can provide an on-going accessible base for the career-guidance and counseling of students. In order to illustrate the possible implications of the TALENT findings for improvements and developments in a guidance system, four of the aforementioned components will be briefly reconsidered.

1. Research and Evaluation. Project TALENT serves a two-fold function here. First, its findings vividly clarify some of the major guidance needs of students. These findings provide school personnel with evidence against which to check, and perhaps recommend changes in, their existing guidance programs.

For example, the Project TALENT study indicated that only 18.9% of boys who indicated in the tenth grade that they were planning one of thirty occupations as a career following graduation planned to pursue that occupational goal three years later. Only 31.4% of the twelfth grade boys reported that their goals were the same one year later. These findings which have been validated by studies other than TALENT (cf. Hansen, 1967; Donaldson, 1968) suggest that students need more effective career-guidance assistance.

A second function of Project TALENT relevant to this component is that it provides a prototype of a follow-up study. School districts desiring to conduct follow-up research on their students can profit from a close study of the methodology behind TALENT and might wish to implement selected parts of this monumental study.

2. Personal problem solving skills. In order to help students acquire and practice planning and decision making skills required for making career choices wisely, a "decision-making simulation experience" using the Project TALENT data bank has been proposed. As one part of this activity, a student will be given information on the personal characteristics (e.g., abilities, interests, values, physical characteristics, etc.) of a hypothetical person and will be asked to use appropriate TALENT data to make key decisions which formulate career goals and plans for that person. This student will be able to check the reality-value of these decisions by comparing them with those actually made by a composite group of Project TALENT subjects who had personal characteristics like those of the hypothetical person. By eliminating the need for partners or groups, we hope to be able to avoid the unrealities of the "game" concept and, therefore, have students perceive this as a reality-testing experience not confounded by unnecessary competition.

3. Personal problem solving. The guidance programs of many schools can provide only limited individual planning assistance to students because of the lack of expectancy data based on follow-up studies of former students. If tests similar to those used in Project TALENT are administered, data from Project TALENT can be utilized until such time as more localized predictive-discriminative information is available. Normative data such as are available in the TALENT study serve useful comparison purposes allowing students to investigate their profiles of developed abilities and interests in terms of the actual educational and vocational choices made by TALENT students with similar characteristics.

Similar comparisons of test scores can result in students receiving probability information estimating their probabilities for entering different career fields. Students must be helped to accept a balance of confidence and skepticism relative to such information as well as to

understand that their present performance levels can be changed. Those who find themselves faced with low-probability goals must be given opportunities to identify the abilities which produce these probabilities and be allowed to improve their status levels if they so desire.

4. Prescribed learning experiences. With the type of utilization of Project TALENT data described under the previous component, consideration can be given to the development of guidance programs which capitalize on the information processing capabilities of a computer. Here a computer would be programmed to match student test data and TALENT predictive data and to combine this with student goals and plans. On the basis of this processing specific recommendations would be made to students. These recommendations would be prescribed learning experiences intended to help them resolve educational and vocational planning problems they might be experiencing. For example, specific job information, direct reference to resource materials or to community resource personnel available for job visitations, or notification of a group counseling activity on vocational problem solving might be some of the recommendations stored in the computer. A computer monitoring system such as this would constitute an effective detection device for alerting counseling personnel to students who seem to be experiencing personal career planning problems.

A Recommendation to Vocational Educators

One of our basic purposes in developing and evaluating parts of a comprehensive vocational guidance system for individualized education is to identify behavioral objectives and related student outcomes for all system components. Using these as references, school personnel should be able to compare them with objective indicators of their students' needs in order to select system components and specific guidance techniques and procedures to consider implementing in local school settings.

The vocational educators connected with the area vocational center noted earlier in this presentation are following this approach using some of our initial work. Guidance personnel from the school districts involved are recommending research and development on parts of four of the twelve components in order to try to help prospective vocational students meet their educational and vocational planning needs. It is anticipated that elements of the following four components will be individualized to their students' characteristics and investigated: personal assessment, personal choice opportunities, personal problem solving skills, and personal problem solving. The Project TALENT data bank will be utilized to develop a discriminative-predictive tool to assist student goal selection and planning.

If this investigation is conducted, it is hoped that vocational educators in other settings will study this type of approach and be able to use this investigation's findings to improve guidance programs. Apparently this guidance-related problem exists not just in one California vocational center. A survey of fifteen Georgia area vocational schools came to this conclusion:

> The data indicated that the current performance of student personnel services in area schools was inadequate and was not meeting the needs of the students. (Bottoms, 1966, p. 42)

MUNICIPALITIES AS A MODEL FOR NEW CAREERS AND REDIRECTION OF VOCATIONAL-TECHNICAL EDUCATION PROGRAMS

An Introductory Thought:

It is written in the BOOK OF DANIEL: "Many shall run to and fro and knowledge shall be increased."

But DANIEL does not say whether this is good or bad. Certainly in modern times the results are not always worth the effort. These are the days of frequency of contact; yet one of our tragedies is that improvement in the techniques of communication has not appreciably bettered the product but has made the communicators more nervous. We are more busy without necessarily being more thoughtful.

These are also the days of accelerated fact-gathering and vast stores of information; yet much of it is unused or misused because, contrary to the popular notion, facts seldom speak for themselves and are not always understood when they do. Nor, when understood, are they always accepted or acted upon. To publish the truth is not enough. Facts must have people to speak for them.

These are especially the days of number gathering. Indeed so eager is the pursuit of the splendid game of "quantifying" that we have a new kind of academic man who presumably would count the very buttons on his executioner's vest. Knowledge is increased and great movements are started -- or are said to be started -- by pollsters, those scientists of the arcane who, after packaging the great issues of the day for quick and easy consumption, rush about in search of instant public opinion: in five minutes or less answer yes, no or maybe to the latest burning questions.

The research and allied activities of the Institute for Local Self Government, Claremont Hotel, Berkeley, California, provide a bridge between the academic community and the local government practitioners. They are broad-based, flexible and keyed to operational realities. They are intended to result in "Designs for Action," to promote and strengthen the institutions and processes of local self government.

Municipalities as a Model for New Careers and Redirection of Vocational-Technical Education Programs

---

LADIES AND GENTLEMEN:

The 26 million youth who will be seeking entry into the labor market during this decade are a far greater number than the United States has ever had to educate, train and absorb into employment than any previous ten-year period. Finding employment for young workers -- entering at the rate of 50,000 a week -- at a time when the new technology is reducing the traditional entry jobs posits grave responsibilities for even so resourceful a group as the nation's vocational educators.

The nation's most rapidly growing employment opportunity is State and Local government employment. There were 12.0 million civilian public employees in the U.S. in October, 1967, or 548,000 more than a year before. The increase was accounted for mainly by State and Local governments which had 9.0 million employees as against 8.6 million in October 1966.

Public civilian payrolls for October, 1967, were $6.1 billion, or about $634 million more than the same month the previous year. The Federal portion amounted to $1.8 billion with payrolls of State and Local governments at $4.3 billion a month.

Total government employment in the United States has risen each year since 1947, with State and Local governments accounting for most of the changes in this 20-year period. From a peak of 3.4 million in World War II, federal civilian employment fell to 2.0 in 1947, then rose to 2.5 million in 1951 and as of October, 1967, stood at 3.0 million, with the recent increase mostly for national defense and postal services.

State and Local government employment dropped slightly during World War II from 3.4 million in 1941 to 3.2 million in 1945. Since then it has shown significant increases every year. During the 16-year period ending October, 1967, the full-time equivalent number of State and Local government employees rose 99% and the October payrolls of these employees went up 323%!

There is no reason to think that these trends will not continue. The Bureau of Labor Statistics estimates that during the next seven years, State and Local governments will need to recruit 2.9 million new administrative, professional and technical employees (excluding teachers) to fill new positions and replace those retiring from Local government public service. The great bulk of the present Local government department head and higher level was recruited during the depression and will soon be retiring. Assuming an annual work year of 250 days, this means that State and Local governments must recruit 1,000 new APT employees every working day for the next decade!

The biggest increase will be in jobs that presently require the most education and training to enter. According to the U.S. Department of Labor, Occupational Handbook, 1968-69, professional occupations presently requiring the most education and training will grow twice as fast as overall Local government public employment, (already noted as growing at the rate of 1,000 APT people per working day). Scientific and engineering employment will be the fastest growth segment, over 30% greater than the administrative, professional,technical group as a whole. As with the rest of the economy, public service jobs involving purely routine tasks are decreasing as a percentage of total jobs.

These changes have been aptly described by Norman C. Harris of the University of Michigan:

Professional jobs, making up six percent of the labor force in 1930 will probably constitute 12 percent by 1970. At the other extreme, unskilled, semi-skilled and service jobs, which together accounted for 56 percent

of the labor force in the 1930's will by 1970 decrease to only 26 percent of the labor force. But the really significant changes in our labor force, and in society in general, have occurred at the level of the semi-professional and technical... . These jobs taken together, will account for over 50 percent of the labor force by 1970. 1/

Continuation of present academic preparatory programs, as now constituted, gives us no reason to believe that there will be any tremendous upsurge in the number of people being prepared for APT careers in Local government. The statistics that are available indicate a relative decrease during the past five years. Consequently Local governments need more APT people and the educational institutions are providing relatively fewer such persons for the local public service.

Local government manpower in types and numbers needed simply will not be available unless alternative, innovative strategies for filling the needs are adopted. One answer to the dilemma is the utilization of subprofessionals for whom New Careers in public employment can be developed.

New Careers offers a very bright hope for utilizing subprofessional personnel for those tasks which require something less than fully professional attributes and skills; which, at the same time, will allow professionals to devote themselves to professional activities instead of taking up their time with less than professional ones. The manpower equivalent of a fully operational New Careers program in a municipality should increase the professional availability of employees by at least 20%, at a cost of less than half of hiring one new professional for every five now employed. Not only will New Careers be created,

---

1/ Harris, in Higher Education in an Age of Revolution, ed. G. K. Smith (Washington: Association for Higher Education, 1962), p. 111.

but local government better and newer services and functions now being neglected because of manpower shortages can be provided to urban residents.

The utility and importance of New Careers has increased because there has been no noticeable improvement in the municipal manpower picture since it was characterized in the Manpower Report of the President to the Congress of the United States, in March, 1965:

"The great growth in cities and the increased demands for services that derive from such growth underlie the shortages of qualified prpfessional, technical and administrative personnel in this branch of government. City governments have manpower shortages not only in occupations where personnel is generally scarce ... but also in new occupations resulting from urban growth.

"The result is that many urban dwellers do not receive all the services they need and that many of the services they do receive are of poor quality. ..."

From the viewpoint of the Institute for Local Self Government which is a unique nonprofit research and educational institution whose natural and only constituency is the operating local government official but which nevertheless maintains intimate relationships with vocational counselors, educators, and institutions of higher education in California; it became apparent that a trailblazing project was in order to harness the twin conditions of local government manpower shortages with the untapped potential of the educational institutions in educating and training subprofessional personnel for New Careers in municipalities. We sought and obtained assistance from the Division of Comprehensive and vocational Education Research, Bureau of Research, U.S. Office of Education (here gratefully acknowledged) to undertake a two-year project which would open new entry level career lines in local government based upon properly prepared subprofessionals.

The project combines the realities of local government public service with the efforts of educational institutions to provide curricula fitted to the needs. During the past year working through nine task forces composed of the leading, active, professional personnel selected from the city halls on the basis of recommendations from the League of California Cities, we have microscopically examined the most common municipal professions and extracted from major omnifarious duties the various subprofessional tasks which can be grouped together to provide an entry-level subprofessional job that has utility and meaning as the basis for redirection of Vocational-Technical education. These have been networked into career ladders which, depending on the motivation, aptitude and abilities of the New Careerist himself can lead to lifetime, fully professional work.

It is not an easy task. It is not a simple matter to get a professional to admit that some of his roles are paraprofessional or subprofessional; and, once having overcome that hurdle it is not easy to acquire their assistance in laying out a continuum in which advancement from entry to full-fledged professional level can be negotiated by those entering New Careers programs. Because of the active cooperation of city halls in California, I am pleased to report that in all nine professional areas we have accomplished these goals primarily because the process was conducted by an institution in whom the professionals had faith built on years of tandem tilling in the local government vineyards of California. Based upon the experience and from our study of other agencies which have been involved in breaking out and cluster-grouping tasks from the entry to fully professional levels, it is our finding that the job cannot be done satisfactorily by outside consultants or one-shot contractors who have scant knowledge of the nature of local government conditions and who lack working intergovernmental relationships.

To illustrate the latter point, I must mention the extremely able help, assistance, support and sound advice which we have received from the

Division of Vocational Education in the California State Department of Education. Because the Institute is recognized in California as working for and with local government public agencies as a nonprofit research and service organization, there has never been any question of our freedom to ask for such cooperation. Intergovernmental internecine warfare is alien to California's governmental climate.

The project's main purpose is to make a contribution to education by providing models for curriculum experimentation to prepare individuals for roles as employed adults in work of social and societal significance. Educational institutions and vocational educators in particular can thus become better attuned to the local government public service needs and be assisted in upgrading their competences in that regard. It is our intention to broadly broadcast known employment needs and proposed curricula to fulfill them.

By mid-1969, the Institute for Local Self Government will have a fairly comprehensive series of curricula which can be readily adapted by any junior college in the country for the purpose of educating and training the required subprofessionals. These optional course groupings are intended to be of benefit and assistance to the counselor at the junior college and high school level. The course work will have been suggested as a result of a year's liaison with both educators and practitioners. This is one of the unique features of the Institute's project. It has been consciously, painfully and perhaps somewhat slowly done in order to make as certain as possible that any potential flak from professionals at work in the city halls will not result in shooting down the proposals. The curricula are not those of the Institute, nor of the educators, but primarily those of the professionals whose task analyses form the skeleton for them. These analyses and our knowledge of what local government employees do in their daily work have been reviewed by the educators, as well as during many discussions with the State's Division of Vocational-Technical Education and

there is every reason to believe that the resultant blend will go smoothly down all palates concerned.

One of the interesting developments of the project has been to note the changes that have taken place at every leg of the working network which might take the form of a triangle : operating municipal officials, vocational educators and curriculum planners, all of whom have had a tendency to proceed in three unrelated and uncoordinated (not to say discombobulated) directions. If nothing else, we have at least succeeded in bringing these three groups together to talk about the same goal in the same terms at the same time.

For fulfillment of modern manpower and social goals, a New Careers program should revolve around the following elements, supported by a policy commitment from legislatures and city councils:

-- Productive entry-level positions, not "make work jobs".
-- Training immediately available, integrally connected to entry-level positions and supported by a commitment of the local government's personnel, time and funds.
-- A clearly defined career ladder between entry-level positions and through the hierarchy to fully professional and career ranks.
-- Relevant training for higher positions available through the job with released time when and where necessary.
-- A close link between training in job skills and general continuing education necessary for career upgrading.
-- Definition of training programs and their packaging as part of local government's responsibility to insure employee upgrading.
-- Creation of career pathways upwards for both old and new careerists.

None of the elements noted above are anything more than positive aspects of a modern municipal personnel system applicable to all persons in the local government public service.

From the examination of typical local government services and functions the utility of New Careers to the total operational setting in the world of administrative and political reality has been proved at the local level. We are about to embark on the second year of the project, early in which our curricula recommendations based upon dozens of task force meetings

will be suggested for implementation through educational institutions so that they can be of assistance to the local governments in their communities. From the view on the local government bridge, there will be provided to vocational counselors and educators a complete package consisting of three major elements: (1) a breakdown of professional tasks into meaningful job descriptions which describe work as it actually goes on in typical municipal professions, (2) a sequential career ladder consisting of realistic clusters of increasing professional consequence from entry to fully professional status; and, most importantly, (3) the coupling of readily adaptable curricula to fulfill the subprofessional manpower needs of our local government sector.

We believe this activity will help solve pressing manpower problems and provide the opportunity to initiate constructive local government policies which can also assist the disadvantaged members of our society. Local government requirements and desires for more efficient public service can be wedded to the quest for constructive and socially useful employment by initially unskilled and semi-skilled people. It is not stopgap employment, but the addition of a more permanent resource and new dimension to long range manpower needs and the job needs of our increasingly youthful population.

Not neglected should be the obvious pathway which New Careers offers for educational institutions now seeking "involvement" with its own community and the manifestations of our country's major domestic problem areas. The information, techniques and suggestions developed in our fashioning "Municipalities as a Model for New Careers and Redirection of Vocational-Technical Education," provide opportunity for educational systems and vocational counselors to redirect their vocational-technical curricula and preservice programs, particularly as they seek relationship with and to the disadvantaged against the background of the rapidly developing new occupations caused by the changing conditions in local government functions.

New Careers can bring to both the educator and the public personnel administrator the most stimulating post World War II catalyst for rethinking and reorganizing processes and techniques which may have become hidebound and obsolete bearing little relation to the purposes of either sound public personnel policy or vocational-technical education. While the concept is relatively new and there is little hard data from which to make positive predictions, the results of the activities during the past three years can be seen in various public agencies which generally report favorable experiences of lasting value:

- -- Improvements in the delivery of local government services to the populace both in terms of existing programs and functions as well as forecasted new ones.
- -- Improvements in overall training policies and programs by development of comprehensive on-the-job skill training coupled with continuing education opportunities for all personnel.
- -- Catalytic activities in personnel systems including less emphasis on written examinations for some unskilled and semi-skilled positions; "outreach recruitment," elimination of cultural biases in written examinations, installation of comprehensive employee orientation programs, modification of arbitrary initial credentials such as a high school diploma when such are unrelated to job performance or skills necessary for efficient and economical public service.
- -- Increases in the supply of manpower necessary to meet local government needs as well as enhancement of the role of professionals by allowing them to eliminate less-than-professional tasks and activities from their jobs, thus effecting the economies that result from not wasting expensive professional talent on unskilled work.

As noted by Grant Venn, guidance in vocational and technical education is not an issue but rather a problem that is manifest when virtually every study of the field decries the wide gap between what is said about guidance and what is done.[2/]

2/ Venn, Man, Education and Work, (Washington: American Council on Education, 1964) p. 147 ff.

The National Manpower Commission put it this way:

> Although a youngster often reads about different kinds of work with which he can have no firsthand experience, when he thinks about choosing a field of work he is most influenced by occupations he has actually encountered. Generally, these occupations are limited to the principal professions and the services and trades he becomes acquainted with in the course of his daily life.... 3/

In a nation 70+% urbanized, there are very few young people, indeed, who have not "actually encountered" local government nearly every day of their lives. If the National Manpower Council is right, and as education more and more becomes the bridge between the individual and his work, vocational guidance and educational guidance become inseparable. Consequently, it behooves the educator and counselor to know and understand New Careers as an important new ingredient in the counseling/placement process because of the many new doors which the concept opens. New Careers falls well within the recently assumed new importance of vocational and technical education. The dramatic rise in youth unemployment and underemployment, the shortage of badly needed personnel in many technical, semiprofessional and skilled occupations and the rising demand for new educational opportunities both at the secondary and post-secondary levels bring the spotlight to bear on the performance and relation to reality of both the educational establishment and its counselors.

The redirection of vocational-technical education becomes an imperative because modern conditions create a new relationship between man and his work in which education is placed squarely between man and his employability. Although this is nothing new for some men and some work such as for professionals in the local government public service, the relationship may now be said to exist for all men and for all public service. And, that's where the necessity for vocational-technical educators to understand and utilize New Careers concepts comes in.

3/ National Manpower Council, A Policy for Skilled Manpower, (New York: Columbia University Press, 1954), p. 266.

In the process of such understanding the vocational educators should take it upon himself to visit local governments in his community to determine what the particularized employment opportunities are within the global, nationwide figures mentioned in the opening paragraphs of this paper. While State and local government employment has the "growth industry" dimension noted earlier, it will, of course, be manifested in different ways in different local areas. Armed with that finite information, the vocational educators can,hopefully, influence the curriculum planners to redirect vocational-technical education suited to the local needs. One hopes that Public Service Education would become at least as widely offered in junior college curricula as Cosmetology, which our research has shown, for example, to be the most widely offered course in California's vaunted junior college system.

The project "Municipalities as a Model for New Careers and Redirection of Vocational-Technical Education" has a potential of achieving at least a dozen goals. They are:

1. Assist in overcoming persistent manpower shortages in the local government public service ...

2. Create not jobs which can easily lead to nowhere, but careers; a sequence of jobs firmly integrated in the professional structure of local government which offer both permanence and the possibility of advancement ...

3. Identify newly developing occupations in local government's fast-changing occupational needs in order to orient educational institutions, curricula developers and vocational counselors to those needs ...

4. Recommend courses, programs and curricula that will provide the necessary subprofessional personnel ...

5. Improve the quality and quantity of services for urban residents ...

6. Provide job and New Career opportunities that contribute to the well-being of society ...

7. Provide models for curriculum experimentation to prepare individuals for roles as employed adults in work of social and societal significance ...

8. Increase the use of professional, administrative and technical personnel time on those tasks and roles which best utilize their scarce competences and thereby allocate routine and other tasks to provide entry level jobs for New Career people with less formal education and training than the professionals ...

9. Provide an opportunity for the education and training of the disadvantaged members of our society ...

10. Institutionalize and evaluate the results both in terms of a pilot city hall and several educational institutions in California ...

11. Provide a model useful and utilizable by both local governments and education systems throughout the country ...

12. Through the utilization of New Careers concepts, provide a direct link between the educational institutions and their surrounding communities and thus provide a meaningful avenue of "involvement" in keeping with the things educational institutions do best --- education and counseling.

With this somewhat full background, let me close the formal presentation of the ideas, concepts and goals of "Municipalities as a Model for New Careers and Redirection of Vocational-Technical Education" by listing what may be considered the half-dozen principal issues for educators and counselors. Perhaps this will serve as a kickoff point for the discussions by Drs. Smith and Worthington, our "reactors" this morning:

1. What tasks currently being performed by professional personnel are routine and can be performed as well, or better, by other staff, specifically trained to perform them, specifically New Careerists.4/

2. What opportunities for further education and growth can be offered to the professional now functioning in a traditional role which will make maximal use of his specific talents and build on his acquired knowledge and experience?

3. What will this ultimately mean in terms of the cost of service and the social economy?

4. What steps can be taken to reach out into the community and make available to youth the stepping stones of education and training that are relevant, integrated and realistic?

5. How can educational content be presented in different forms which will make it comprehensible and vital to an enlarged and varied student body?

4/ Adapted from Steinberg & Shatz, "Junior Colleges and the New Careers Program," Junior College Journal, (Washington: American Association of Junior Colleges, February, 1968) pp. 12-17.

6. How will institutions of higher learning meet the demands of current legislation and the determination of the poor for postsecondary education with opportunity to make a significant and recognized contribution to society?

There may be a disquieting absence of leadership among colleges and universities in coming to grips with these central concerns. There is no group better suited in terms of philosophy and past performance, nor better qualified in terms of background and commitment. The issues, however, are still in doubt.

Thank you.

1968 Convention
Tuesday, December 10, 1968

Presented by
Dr. George Parkinson
Director Emeritus
Milwaukee Technical College

Report on "The Evaluation of Residential Schools and the Essential Factors Which Contribute to Their Operation"

In Title I of the Vocational Education Amendments of 1968, Part E, Section 151, paragraphs (a) and (b), there is provision for demonstrating the feasibility and desirability of Residential Vocational Education schools for certain youths of high school age.

There are authorized to be appropriated for the purpose of this section $25 million for the fiscal year ending June 30, 1969; $30 million for the fiscal year ending June 30, 1970; $35 million for the fiscal year ending June 30, 1971, and for the succeeding fiscal year. There had been provision or authorization for such schools dating back to the Vocational Education Act of 1963, but no funds.

In July of 1968 the Department of Health Education and Welfare funded a project with the Milwaukee Technical College for "The Evaluation of Residential Schools and the Essential Factors Which Contribute to Their Operation." This contract began on July 1, 1968 and will terminate on March 1, 1969. The purpose of the project is:

1. To study and evaluate a number of residential schools in terms of the factors which have contributed to their successful operation.

2. To prepare guidelines which reflect the findings of the study and evaluation and which may be helpful in planning a model residential school.

3. Eventually to have the guidelines tested against the experience of developing a model residential school.

The following procedure was implemented by the Milwaukee Technical College in carrying out the terms of this contract. A task force was created which would carry out the study indicated. One of the first points which they addressed themselves to was the development of an instrument which could be sent to the schools to be visited and which would provide much preliminary information. This instrument was to be followed by an on-site visit by the task force and in-depth interviews with the head of the school and the heads of the various divisions of the schools, particularly in terms of the instrument which had already been sent to them.

After these visits will be completed this week, there will be an in-depth study with the consultants of the visits to these various schools, each of which was different from the other and each of which has something to contribute to the total problem under consideration.

All together there will have been visited thirteen (13) residential schools in the United States covering the western part of our country, the southern part, the central part and the eastern part. The study has involved tax-supported schools, independent institutions, and church-related institutions. The study also involves large schools and small schools; co-educational and strictly men's schools, so that all aspects of the problem will have been considered in the careful study and analysis which will be reported to the Department of Health Education and Welfare this coming spring.

The final phase of the report will involve a proposal of one or several types of residential schools which have all of the elements which are necessary for the successful operation of such schools and which will to the maximum extent possible avoid the pitfalls which have been found by the various school administrators of the schools which have been visited.

In addition to this there is currently under development a proposal for a workshop on planning residential schools to be carried out jointly by the Vocational Division of the Department of Public Instruction of the State of Ohio, the State Vocational Office of the State of Wisconsin, and the Milwaukee Technical College, during the coming spring. This would give the planning administrators from over the country an opportunity to gather together and discuss certain aspects of the planning problems which they will meet. This joint project plans to use as a resource agency the Mahoning Valley Vocational School near Niles, Ohio, and will also be based in part on the results of the study currently being carried out by the Milwaukee Technical College. This proposed project will of course have to compete with all of the other proposals for workshops for next summer which will be submitted for consideration.

Copies of the proposal for the present study, of which this is a report, are available for distribution at the end of this meeting.

STUDY OF CAREER PATTERNS AND CURRICULUM EMPHASES IN PUBLIC EDUCATION

Eleanor P. Godfrey, Study Director

Paper presented at AVA Convention, December, 1968

TEACHER BACKGROUND, TRAINING, AND OPINIONS

In 1967, the Bureau of Social Science Research, supported in part by funds from the U. S. Office of Education, conducted a nationwide survey of career patterns and curriculum emphases in education. A major purpose of the study was to compare the backgrounds, training, and opinions on some important educational issues of secondary and postsecondary academic and vocational teachers. This report presents some of the results in these areas of inquiry.

The Sample

Four major institutional types were represented in the sample of schools--comprehensive high schools, vocational high schools, vocational-technical centers, and junior or community colleges.

Secondary sample.--The basic sample consisted of approximately 180 public school districts, stratified by secondary enrollment size, drawn at random from the latest available (fall, 1965) Directory of Public School Systems provided to us by the U. S. Office of Education. Only those districts whose estimated secondary enrollments were 600 pupils or more were included in the study population. At least one comprehensive high school was chosen at random from each of the 180 districts. In addition, a vocational or technical high school was selected in each of the 40 sample districts that operated such specialized facilities.

Postsecondary sample.--For each school district at least one public postsecondary two-year institution providing occupational training (area vocational center, technical institute, junior or community college) was identified according to one of the following criteria: (a) designation by the state education agency as the postsecondary institution serving the geographical area in which the sample school district is located, or (b) within "reasonable commuting distance of secondary schools within the district. Approximately 90 of these institutions were selected to represent the range of postsecondary programs available.

The response by type of school and class of respondent is given below:

	Sample Number	Usable Returns	Percent
SCHOOLS	310	249	80%
Comprehensive high school	183	147	80
Vocational high school	39	29	74
Vocational-technical center	34	26	76
Junior college	54	47	87
RESPONDENTS FROM THE 249 SCHOOLS			
Chief administrator	249	220	88
All administrators	820	680	83
Counselors	930	807	87
Teachers	15,300	11,649	76

The distribution of the teacher respondents for each type of school and subject taught is given in the attached Table B-1. Tables B-2 through B-4 present background characteristics. Tables CO-1 through CO-6 present opinion data.

TABLE B-1

TYPE OF SCHOOL WHERE TEACHING BY SUBJECT TAUGHT
(In Percentages)

Subject	SECONDARY TEACHERS						POSTSECONDARY TEACHERS			
	Number	Small High School[a]	Medium High School	Large High School	Very Large High School	Vocational High School	Number	Vocational-Technical Center	Small Junior College[b]	Large Junior College
TOTAL	8648	14.4	17.5	20.8	32.4	14.8	3001	22.6	28.9	48.5

▫ EDUCATIONAL ISSUES ▫

The last group of questions concern a number of important issues currently being debated by educators (and the general public). Because the issues are controversial, we have summarized two or three major positions on each and are asking you to choose the statement which compares most closely with your own thinking. *Please circle one number for each statement* and *add any comments you desire.*

20. The best way to train for jobs requiring less than a bachelor's degree is to:

Table CO-1

Emphasize general education through grade 12, reserving occupational training for grades 13 and later 1

Give high school students the opportunity to explore various occupations, but let industry provide specialized skill training "on the job" 2

Provide intensive occupational training in the high school 3

21. The rapid increase in the number of two-year colleges raises serious questions about the functions these institutions should serve.

Table CO-2

A two-year college can not have both a high quality academic program and a high quality occupational program. Each institution should specialize – – either in lower division college work or vocational and technical training 1

Although one institution can provide both an academic and an occupational program, it is poor educational policy to teach both types of students in the same classes 2

A two-year college has the obligation to provide all students with the same general education courses. Taking classes together is beneficial to those in both occupational and bachelor's-oriented programs 3

22. More intensive vocational training and guidance in the junior high school would:

Table CO-3

Enable students to become acquainted with the world of work earlier and therefore make more realistic educational and occupational choices 1

Encourage students to make up their minds too early and restrict their future educational and occupational careers 2

Be impractical – junior high school students are not mature enough to profit from such experiences 3

Table CO-4

26. Critical evaluation of current occupational programs suggests that they:

Are suited to the abilities of the enrollees and train people for jobs that exist 1

Are based on an out-of-date philosophy and serve neither the student nor the community well 2

Do a good job with the average student but neglect both the slow and the sophisticated learner 3

Table CO-5

27. Introduction of more rigid entrance requirements for occupational programs would:

Raise the prestige of the field. Occupational programs have too often been the "dumping ground" for academic failures 1

Exclude the very students these programs should serve and still not attract the high ability student because of the general public emphasis on the importance of a bachelor's degree 2

Table CO-6

24. The charge that students with a vocational major in high school cannot "make it" in college:

Is more apparent than real because students in both college preparatory and vocational programs take the same basic prerequisite courses 1

Is a serious one because the "academic" subjects taught vocational students do not meet standards for college entrance 2

Is true, but beside the point, because most vocational graduates do not have the ability to handle college work 3

"APPLYING SYSTEMS ANALYSIS TECHNIQUES TO THE EVALUATION OF VOCATIONAL PROGRAMS"

American Vocational Association Conference
Dallas, Texas
December 11, 1968

Alan G. Robertson, Director

University of the State of New York
The State Education Department
Division of Evaluation

The purpose of our discussion with you this afternoon is to present in elementary form, a way of organizing an evaluation program or project so that the subject of the evaluation can better facilitate the measurement process and so that the results of measurement can be directly applied to change or modify the program itself.

To start, we seem to hear from those who are promoting an awareness of evaluation and writing guidelines for standards and the like that the first order of evaluation is to define the objectives of the program in so-called "behavioral terms". This basic technique is supposed to unlock the doors of understanding so that all we have to do is select valid measurement techniques, including tests, questionnaires, rating scales and the like, apply them to the correct segment of the project outcome, tabulate the data, draw the influences and go off to new bigger and better evaluations thereafter.

While we have heard the cliche "write objectives in behavioral terms" over and over again, most of the time it seems to stop at this point without going any further. When we press the point, "behavioral terms" by context is thought to be purely human behavioral and most often individual human behavior.

First of all, all behavior in the evaluative usage isn't always individual - it is more often in terms of small groups and sometimes in mass populations; very often this behavior does not include any physo-motor or cognitive learning changes in the subject matter achievement sense or context. For example, in a broad sense, a change in attitude of a shop teacher toward the vocational readiness or aptitude of a group of inner city black students is behavioral - it can be thought of as "inward behavioral" instead of "outward behavioral". Or suppose we have an industrial evaluation project in which we are trying to determine if controlled variations in frequency and angle of incidence of the illumination of the work stations where metal burnishing operations are carried out will reduce the number of rejections of the pieces and perhaps improve texture uniformity. Now if we think in the most common meaning of "behavioral" we are tempted to focus on workers and work methods as the variable to be manipulated or the object of what our measurement should be. In this illustration it would not be since theoretically work methods or processes are not changing. However, the nature, or characteristics or if you please "behavior" of a lot (given quantity) of similar metal products is the object of measurement and in fact a given characteristic or characteristics of a similar lot (in quantity), namely the number of rejected pieces for a given reason is our baseline criterion measure against which we decide if behavioral changes are taking place.

As a matter of personal preference, I would rather talk about "objectives" expressed in terms which express, imply, or lend themselves to the measurement of change (of any kind) and leave the "behavioral" terminology to the psychologists.

Where systems analysis techniques assist the vocational education evaluator is that they enable him to better pick out the stage (time sequence) of the program operation he wishes to evaluate, identify the relevant elements in the piece of the program under scrutiny to the outcome changes we are trying to measure. Of course, we very often have to measure a vocational program from start to finish, and account for all elements in its success or failure. In this case, systems analysis techniques help us to compartmentalize or classify these elements, string them together in a series of circuits so that interrelationships may be established and judgments can be made about their relative affect on the nature of the end products.

Now before we begin to walk through some analysis models, let me say that application of systems analysis techniques to evaluation differs from PERT or Program Evaluation Review Technique, in that PERT focuses on the steps and time and other expenditures in the identified evaluation or research processes, while what follows is to be thought of in terms of the operating program not the evaluative process per se.

Furthermore for the sake of keeping ourselves pragmatic and less theoretical, let's pretend that we are involved in evaluating a state system of brand new area vocational programs, which all started from scratch in 1965 (PL 88-210 "scratch" that is) and already at the close of 1968 are showing variations in program quality and effectiveness even though they have identical plants, equipment, and programs. Let's also assume that we have the necessary staff (our own or under contract) and funds to do a total evaluation. However as we walk through these models, remember that we can also use each separately, if we were only going to evaluate a single aspect or cluster of influences on the program's success.

These can be divided into four areas:

I - CONTEXT EVALUATION - A look at the ecology or environment in which each program was started and is currently operating. Two similar programs operating for a period of time under different conditions may have different program results and in fact <u>appear</u> to be different.

II - INPUT EVALUATION - Examination of student characteristics, public relations techniques, admission and course selection policies, teacher recruitment and characteristics etc. to determine affect upon program success variations.

III - PROCESS EVALUATION - To identify critical elements in the on-going program over a period of time such as administrative policies, in-service training, teacher supervision, allocation of discretionary funds for instruction, use of advisory committees, pupil grouping, etc. which may have had a major influence on program outcomes.

IV - PRODUCT EVALUATION - Identification of program success criterion measures such as student proficiencies, program holding power, rapidity and nature of initial placement, student performance ratings of employers, etc. and their relation to Context, Input, and Process variables.

The following visuals expand upon the above further.

A Classification System for Evaluating Long Term Progress or Change

I - Context Evaluation

	*THEORY	OPERATION
A - OBJECTIVE	To define the operating context or environment at different stages in time; to identify and assess needs or problems in the environment which the program product was intended to supply or alleviate.	Identification of the component parts of the geographic area for which the program was designed such as economy, population, labor markets, competitive educational opportunities, financing, community interest and community elements leadership roles.
B - METHOD	By individually describing the major sub-systems of the context in their relevant perspectives and by analyzing the intended versus the actual inputs, it is hoped that causes of discrepancies between intended and actual system inputs can be determined.	Break up the objective operations into clusters of sub-problems. Identify what would have been the ideal program solution for each, if the climate and resources were unlimited and each was not related to the other. Compare with the actual program characteristics which were adapted. Test for relevancy to the operational objectives above, examine feasibility of alternates, and estimate cause and validity of the limitations on what would have been the ideal program.
C - APPLICATION	For determining if the operating program is a direct outcome of the original program need; for validating if the original contextual elements still are valid for the program today and in the same degree; for revising original goals and objectives.	Basis for determining if initial planning for program needs to resurveyed or reevaluated (area study). Basis for determining if contextual element changes are serious enough to warrant program modifications or drastic revisions.

*Adapted from the Clipp Evaluation Model - Ohio State University.

A Classification System for Evaluating Long Term Progress or Change

II - Input Evaluation

	*THEORY	OPERATION
A - OBJECTIVE	To identify and assess the capabilities of the instructional system, the input strategies, and the administrative and supervisory designs for implementing the strategies in terms of program inputs.	Compare actual inputs into the school program versus those which were identified in the program planning stages and for which the area instructional program was designed. Determine continuity of policy and program if actual inputs have differed from those which were estimated.
B - METHOD	By describing and analyzing available and material resources, solution strategies and procedural designs for relevance, feasibility and economy, the best program course of action may be determined.	Survey or estimate what is needed: policy, plant, staff, equipment, supplies, communications, transportation, students. Determine what is available in light of necessary changes in that which must be obtained at varying degrees of cost. Set up a timetable of input changes versus the practicality of their implementation so that the educational system does not function less efficiently during the changeover or program strengthening processes.
C - APPLICATION	For selecting those sources of additional support appropriate to the segment of the instructional program which needs to be strengthened, or for selecting sources of support from I A and B (Context Evaluation) operations, solution strategies, and procedural designs for programming instructional change activities if needed.	To determine which student, faculty, and other inputs selection policy and procedural changes need to be made to update a program of instruction. To determine if variances in input policies, strategies, and implementation practices can account for variances in school quality.

*Adapted from the Clipp Evaluation Model - Ohio State University

A Classification System for Evaluating Long Term Progress or Change

III - Process Evaluation

	*THEORY	OPERATION
A - OBJECTIVE	To identify or predict in process, those variances or defects in the implementation or procedural design which can account for differences in program quality, between schools or between the planned program quality level and that which is being achieved.	To recognize when critical points vital to program quality have arisen, to be able to identify the basis for administrative judgments made at these points and to determine which process changes made as a result markedly affected the success or non-success of the whole vocational program.
B - METHOD	By identifying past and present barriers or implementation agents to the present program of instructional activities.	Reconstruct a time line or log of important activities or developments since the program began; compare against original planning and procedures documents, examine annual budgets for shift in program purposes, interview former and present staff, students, advisory committees and the like, relate to perceptions of program development nature and quality.
C - APPLICATION	For implementing and refining program changes; for establishing valid criterion measures as the basis for a system of program quality control.	For on-going decision making whether to continue the present program as originally planned or shift to alternates which are suggested by results of operations under A and B above; for monitoring adherence to program development timetables, for determining if outside experts need to be called in, or if major budget shifts or revisions need to be made.

*Adapted from the Clipp Evaluation Model - Ohio State University

A Classification System for Evaluating Long Term Progress or Change

IV - Product Evaluation

	*THEORY	OPERATION
A - OBJECTIVE	To relate program outcome information to its objectives and to context, input, and process evaluation resultant information.	To have a valid basis for judgments as to the success of the entire program as a whole versus each of its stated objectives; to determine accuracy of previous estimates of student-faculty-community environment variables and input resources, and the total cost-benefit of the operational processes.
B - METHOD	By defining operational and measurement criteria associated with the objectives, by comparing these measurements with predetermined success standards or inter-school comparative bases, and by interpreting the outcomes of the program in terms of recorded context, input, and process evaluation information.	Collect, classify, and assign judgmental weightings to the evaluation results obtained from context, input, and process evaluations. Involve panels of students, faculty, business people, parents, labor, outside experts, to pass upon these judgments before final accounts of evaluation results are written.
C - APPLICATION	For making long range program plans based on evaluation outcomes, for deciding to continue, modify, or refocus, on-going change activities or identifying needed new ones.	Basis of recommendation that original or evolving program of vocational activities needs to be continued, drastically modified or terminated as completed or ineffective in light of objectives. Basis for pinpointing where short and long range program change planning should take place, estimating timetables, and designing a foresight, rather than hindsight system of evaluation which can yield needed feedback information as it is going on as a built in program element.

THE DEVELOPMENT OF ACHIEVEMENT TESTS FOR TRADE AND TECHNICAL EDUCATION: A THREE YEAR SUMMARY

THOMAS S. BALDWIN
UNIVERSITY OF ILLINOIS

The initial few months of the project were devoted to meetings to orient the project staff to the area in which we would be working and to discuss special problems that might arise. Meetings were held with a number of technical institute presidents as well as with members of the North Carolina Curriculum Laboratory to familiarize all concerned to the purpose of the research and to provide insight into the methodology. Several discussions were also held with psychologists and master tradesmen about the proposed development of a conceptual framework for the research on skilled psychomotor behavior.

During the summer of 1966, all institutions that had been invited to participate in this project were visited. Information as to the objectives of our research as well as the actual operating procedures were outlined. Wherever possible, instructors in the institutions involved were included in the explanation of the project and over twenty were placed under contract, having agreed to detail and analyze the curriculum they teach. Also, some instructors began writing test items for later use; as a pool of items was developed, guidelines for a very preliminary form of the tests became established. The area of psychomotor research also received much attention as several trips were made to consult with the military about any achievement measurement underway at the time. Since no work had been done in this area, the majority of people visited could only offer suggestions.

During the next several months, all additional instructors needed as field consultants were procured, thus each curriculum had approximately five instructors analyzing it. The last three weekends in October, 1966 were devoted to meetings with the field consultants, the purpose of which was first to arrive at a consensus concerning the curriculum analysis; secondly, to plan ways and means of developing performance tests; and thirdly, to evaluate items which had already been developed for the test item pool. Detailed outlines of each curriculum were developed and a system was decided upon for the classification of the various levels of learning and behavioral objectives. The system was a modification of Bloom's Taxonomy of Educational Objectives, Cognitive Domain, and was classified at four levels: knowledge, understanding, and two levels of application. In order to have some means of comparing student scores on the preliminary forms of the achievement tests, it was decided that each achievement test should contain a battery of reference tests which possess a high degree of reliability and a known validity. An extensive review

of aptitude and achievement tests in print was undertaken. Also, problems concerning methods and techniques of evaluation of the tests were considered and it was decided that various factor analyses would be performed between the subtests and any reference tests utilized. The area of performance tests received considerable attention as well.

In the final quarter of the first year of operation the item-writing committees developed a pool of test items of from 500 to 800 for each curriculum. These items were constructed to represent each topic into which each curriculum had been divided, and at the same time to be representative of the four different levels of learning and behavioral objectives. The two technological areas, which had students graduating in the spring, Electronics and Data Processing, were prepared for administration. In order to examine a maximum number of items, two "analogous" forms of the test in each area were developed. Item analyses would determine, in the future, the most appropriate items from each form to be used on the final form of each test. Scheduling of institutions for both spring technological and summer trade testing was accomplished. Institutions in North and South Carolina, Connecticut, Delaware, New Jersey, and Georgia had agreed to participate. Contact was also made in several other states, notably Colorado, California, Florida, and Wisconsin. In order to help identify the factors isolated through factor analysis, a battery of research instruments entitled "Reference Tests for Cognitive Factors" developed by Educational Testing Service in cooperation with the U.S. Office of Naval Research, was selected. The project staff, in consultation with subject matter specialists and other behavioral consultants, selected from five to eight of these short tests for administration with each of our achievement tests. While basic research in tactile-kinesthetic sensitivity was being conducted, much time was also devoted to designing tactile-kinesthetic sensitivity tasks which were more directly applicable to the manipulative skills required in the trade curricula included in the project. In addition to the work being done in the psychomotor performance area, studies such as automobile auditory diagnosis, a tool identification test, an automobile electrical system trouble shooting test, a static and dynamic analyzation test of television malfunctions, and a diagnostic test utilizing an electronic engine analyzer were under development.

The next several months witnessed a very extensive testing program. The two technologies, Data Processing and Electronics, were completed with testing having been accomplished in five states, 29 institutions, and over 500 subjects being examined. Preparation was underway to begin trade testing in Auto Mechanics, Air Conditioning Heating and Refrigeration, Electrical Installation and Maintenance, Machinist, and Radio-Television Repair. The scoring of the paper-and-pencil achievement tests in the technologies was begun with the aid of an IBM-1230 test scoring machine. Results were punched on data cards for later use in computerized analysis. The reference tests, however, had to be hand scored and this task was also begun. The

performance tests were prepared for use in the various trades, with several of the areas having from four to seven of these in addition to their achievement and reference tests. Performance tests were scheduled separately such that the demand on the students would not be too great.

In the summer achievement testing of the trade areas was conducted. Paper-and-pencil testing teams, as well as the performance testing teams, were occupied much of the time. When the testing had been completed in late August it was found that we had visited 49 different institutions in six states. The total sample for all seven curricula areas came to over 1600 students. During this period the hand-scoring of the reference tests occupied much of the staff that was not out testing. Since each student generated from five to ten tests that required hand scoring, it is conservatively estimated that over ten thousand tests were thusly scored. The data from the two technologies were sent to the computing center for analysis. Computer analysis included, among other things, means and standard deviations for all subtests, performance tests, and reference tests; reliabilities; item difficulty; biserial correlations for each item; response count for each detractor both above and below the means; and subtest intercorrelations. As the trade area answer sheets were returned they were scored and data cards made ready for the computer.

In September, 1967 the principal investigator accepted a position on the University of Illinois faculty. That portion of the project dealing with the experimental investigations in the performance domain was also shifted to Illinois. Thus, the faculties and facilities of two universities were closely coordinated toward the revision and improvement of the experimental achievement measures. The Illinois portion of the project concerned itself primarily with the development and modification of tasks to evaluate the relationship of certain perceptual abilities to the learning of skills in the various trades that are presently being studied. Construction of auditory diagnostic tests in both the automotive and machinist areas was well underway and plans made for modification of the previously unreliable television performance test. The North Carolina State portion of the project concerned itself with the statistical analysis of the test data, dissemination of it to the participating states and institutions, and revision of the tests based on the knowledge obtained from statistical analysis and experience of administration. Committees were again brought together to study the results of the analysis and make recommendations for item inclusion on the final form of each test. The only area where a complete revision was undertaken was in Data Processing wherein it was found that the use of Fortran language almost exclusively was in direct contrast to most of the institutions which used the Cobol language. It was decided, by the committee, to have a Business Option (Cobol) and Scientific Option (Fortran) test made available to administer in the forthcoming year.

The following quarter was devoted to the continued redesign of the performance and paper-and-pencil achievement tests. The results of the performance testing from the previous year were examined for their reliability and decisions were made whether to eliminate, revise, or design new tests for administration. The committees meeting on the paper-and-pencil tests submitted their recommendations and the revisions of the achievement tests were completed. Plans were made for scheduling of the spring technology testing. It was decided that a one-day testing session with two two-hour periods would well accomplish the achievement testing. With the omission of the experimental reference tests from the second administration, six hours were not required as in the previous year.

The Spring quarter at the Illinois portion of the project was devoted to the development and administration of several different types of performance tests. The preliminary form of these tests encompassed three major sensory modalities: tactile-kinesthetic sensitivity, auditory, and visual. The instruments used in the tactile-kinesthetic research were refinements and extensions of experimental investigations in the performance area engaged in earlier on the project. The auditory diagnostic test for automotive mechanics was completed and administered to a sample of about 150 students. The television diagnostic test and machinist auditory diagnostic test were prepared for summer administration. The North Carolina State portion of the project devoted itself almost solely to the administration of the revised achievement tests. The Electronics Technology test was administered to over 370 students from five states, the two Data Processing tests to a collective sample of over 225 students, also from five states. All scoring was done by computer at the University of Illinois and the statistical data were made available in a relatively short period of time.

The summer quarter was devoted to the administration of the achievement tests to the five trade areas. Trade testing was done in seven states with both paper-and-pencil as well as performance tests being administered. The automotive electrical system diagnostic test and the two tests brought to the southeast from Illinois, the machinist auditory and television diagnostic test, were also scheduled during this time. Since these performance tests required significant amounts of time, they were scheduled separately from the paper-and-pencil tests. Computer analysis of the data from the spring technological testing was completed early during this period, and the results were made available to the participating institutions. When all of the trade testing was completed, the sample totaled over 2300 students for the paper-and-pencil tests and 530 for the performance tests.

The next quarter and to the present time has been devoted solely to the tabulation and dissemination of the statistical data. All data has originated from the University of Illinois, where it

has undergone some analysis, and disseminated from North Carolina State, where all of the contacts were originally formulated. Data compilation has taken the majority of the time; however, the results have been personally delivered to each participating institution, thus insuring understanding of the findings and their limitations. An overview has been undertaken so as to make available to all concerned a complete assessment of the purposes and findings. The reliabilities and intercorrelations of each of the subtests of the revised test in each curriculum area is attached.

BREAKDOWN OF PENCIL AND PAPER ACHIEVEMENT MEASURES

MACHINIST TRADE

Part of test	Number of items	Time limit	Area Sampled (Subtest)	Reliability K-R (14)

NEW RESEARCH TECHNIQUES FOR VALIDATION OF THE GENERAL APTITUDE TEST BATTERY[1]

My topic has to do with new research techniques for validating the General Aptitude Test Battery. But first a little background about the GATB.

The GATB has a long history of research. It was developed from occupational validation and factor analysis studies conducted in the late 1930's and in the 1940's. The nine aptitudes measured by the GATB are General Learning Ability, Verbal Aptitude, Numerical Aptitude, Spatial Aptitude, Form Perception, Clerical Perception, Motor Coordination, Finger Dexterity, and Manual Dexterity.

The GATB was developed by the U. S. Employment Service, so its primary use has been in the public employment service. About 700,000 applicants per year are tested by the employment service. Typically these are applicants who have no significant work experience, or who want to explore occupations that differ from those in which they do have experience. Many are high school seniors who are about to enter the labor market.

Since 1959 there has been increasing use of the GATB by school counselors to help students in lower high school grades make

[1]Presented by Robert C. Droege, Research Psychologist, Bureau of Employment Security, U.S. Department of Labor, Washington, D. C.

tentative selections of vocational goals as a basis for planning courses of study in high school. Many State Employment Services have made arrangements with their State Department of Education for State-wide release of the GATB to schools with qualified counselors.

Since its publication in 1947, the GATB has been included in many studies to validate it against overall success in specific occupations (U. S. Department of Labor, 1967).

These studies have been of the traditional kind, involving administration of the GATB to a sample of workers all performing the same job duties, obtaining measures of their job performance, correlating the measures of test and job performance, and selecting the combination of aptitudes with the best validity for operational use in personnel selection and counseling.

So much for background. In recent years we have begun to use new research strategies to refine the validities and to broaden the scope of the studies. The new strategies are being used in validity generalization designs, validity extension designs, and moderator variables are being used as refinements in the research.

Validity Generalization

First of all, we are using some new approaches in the area of validity generalization. Our objective is to develop a compre-

hensive and meaningful aptitude-oriented occupational structure for use by vocational counselors. The adjectives "comprehensive" and "meaningful" are the key words. Neither characterizes the presently operational USES Occupational Aptitude Pattern Structure (U. S. Department of Labor, 1966).

Before getting to the research the USES is doing in validity generalization, I would like to take a little time to discuss some comments on the subject that were made by Ghiselli in a symposium at the 1957 Chicago meeting of the Midwestern Psychological Association (Ghiselli, 1959).

Dr. Ghiselli was very pessimistic about the possibilities for generalizing validity based on traditional validity studies because of the great variability he found in validity coefficients for similar jobs. He attributed this variability in results to three factors:

1. Differences in range of talent in different investigations arising from differences in hiring procedures and in the locally available labor market.

2. Differences in criteria which can vary considerably in psychological meaning even though they appear to be similar.

3. Differences in the jobs themselves from one establishment to another. Two jobs with the same title can differ considerably in aptitude requirements.

He concluded that "Under these circumstances how is it at all possible to collect and integrate data concerning the validity of a test for a particular job? Obviously if the data is inconsistent we cannot set up any general principles about the usefulness of tests in worker selection and placement."

The USES work on validity generalization is being done in a framework that involves the General Aptitude Test Battery and the occupational classification structure of the 3rd edition of the Dictionary of Occupational Titles (U. S. Department of Labor, 1965).

The first USES attempt at validity generalization was made in the 1950's, using validity data accumulated from GATB studies on specific occupations. This effort resulted in an Occupational Aptitude Pattern Structure of 36 groups of occupations with similar aptitude requirements. However, the occupational coverage of the structure is limited, and many of the jobs appearing in the same OAP are quite dissimilar on other dimensions. It does not meet the important requirements of comprehensiveness and meaningfulness.

In general, then, we find little positive evidence of validity generalization from Ghiselli's work or our own initial work in USES. Ghiselli found inconsistencies in validity data for similar jobs; the USES was able to form groups of occupations that had similar patterns of validities, but the occupations

within the resulting groups had little else in common.

Since our original attempt to generalize the validities, we have accumulated much more validity data on many more jobs. We now have data of this kind for more than 500 jobs. Another important new factor is that we now have a new occupational classification structure in the 3rd edition of the Dictionary of Occupational Titles. These two factors have encouraged us to make another attempt at validity generalization.

We started with the proposition that, to be of maximum usefulness to a vocational counselor, any job groupings to be established on the basis of validity generalization data must be psychologically meaningful job families. This is of first importance. Secondly, the structure should be as comprehensive as possible so as to cover at least all of the major occupations. The Worker Traits Arrangements of the DOT is comprehensive and meaningful. It consists of 114 groups of occupations that have similar trait requirement and also tend to involve the same worker functions. The groups may be described as families of occupations that are conceptually meaningful to the counselor.

Our research question was this: When our 500-odd studies are distributed into the Worker Trait Groups, do we get similar patterns of validities for the occupations within each group? If so, we have a basis for generalizing from the studies we have to other occupations on which we have no data.

Preliminary results are promising, and here are two examples. The first example involves two Worker Trait Groups in the Area called "Elemental Work." We have done 53 GATB test development studies on occupations in these groups. There was statistical evidence from 43 of these studies for Motor Coordination, 41 of the studies for Finger Dexterity, and 50 of these studies for Manual Dexterity. This is good evidence for validity generalization for an aptitude pattern involving these three aptitudes. The other example is for the Worker Trait Group "Technical Work, Engineering, and Related Fields." All eight of the studies we have done on occupations in this group showed statistical evidence for General Learning Ability, Verbal Aptitude, Numerical Aptitude, and Spatial Aptitude. Other Worker Trait Groups are being studied in the same way.

Although this approach appears promising, others should also be explored so that the best possible system can ultimately be adopted.

Chiselli's solution was to abandon the traditional procedure of attempting to predict over-all job success and turn to an analytic approach. This would involve isolating job functions and studying their interrelationships and their predictability separately. He goes on to suggest development of standard work samples of different functions; for example alphabetical filing, rough grinding and engine tuning, against which test scores would be validated. I think that this approach has promise and should be studied further,

preferably in a laboratory setting which would permit better control over the samples and the experimental variables.

The specific framework could consist of the DOT-defined worker-function hierachies. Worker functions reflect what workers do and these worker functions can be identified in terms of relationships with data, people and things. Further, the worker functions have been arranged in hierarchies of increasing complexity of function, and this has been done separately for data, people and things-related functions.

Since three functions, one from each hierarchy, express the total activity requirements of jobs in broad terms, we have a comprehensive model to use in developing work samples that reflect these activities. One or more work samples could be constructed for each function and studied in the laboratory as potential criterion measures. Once refined through tryouts and factor analyses, these work samples could serve as criterion measures against which aptitude and other types of tests could be validated under controlled conditions.

Consider the possibilities. We select an experimental test battery and administer it to a sample of individuals representative of the type of counseling population we are interested in. These individuals are also administered the criterion battery of work samples. All of our subjects have taken all of the experimental predictor tests and all of the criterion work sample measures. Thus,

validation of the predictors can be done separately for each of the work samples. Comparability of results is achieved because only one group of individuals is involved and they all are measured with the same instruments.

After the predictor tests most highly related to each of the criterion work samples are identified, we have the basis for taking the next step validating the predictor tests for combinations of work samples representing combinations of worker functions characteristic of occupational groups. Various techniques for doing the validation analysis could be used. The most useful for the employment service would be one that involves a multiple hurdle approach on both the predictor and criterion variables.

As I indicated before, we are getting promising results with a validity generalization approach. But the more analytic approach, using work samples corresponding to worker functions deserves attention even though a project that would provide a good initial evaluation of it would be quite expensive. A vocational high school would be an ideal setting for the project. Such a school would have the facilities required to administer the work samples and tests, and would have students readily available for use as subjects. I would be glad to discuss this further with anyone who might be interested in participating in such a project.

Validity Extension

Now let's turn to research we have been doing to validate the GATB against vocational course criteria.

I would like to begin by saying something about a relatively small-scale study, but one that is of significance to GATB users in the schools. It has to do with "validity extension." Let me explain what I mean by the term "validity extension." Let's say that a test battery is developed on an occupational sample using a criterion of occupational success. When this battery is applied to data for a similar sample and the same kind of criterion is used to see how it works in that situation, we have a study of cross validation. The battery is developed on one sample and we check its validity on another similar sample. But suppose we want to take the test battery out of context, so to speak, and see how it works in a situation where the sample is quite different and the criterion of performance is also quite different. This would be a study in validity extension. Now let me describe to you briefly the specific study in validity extension I had in mind.

We have in operational use in the employment service an aptitude test battery for Compositors. This test battery, based on two samples of employed workers, was developed some time ago. In Indianapolis there is a vocational high school and they have a printing curriculum. The compositor test battery was administered to 70 students enrolled in this curriculum and instructors rated

their performance in printing courses during their first year of study. Analyses of these data showed that the compositor battery, when applied to the test scores and measures of course success of the Indianapolis students, did a relatively good job in differentiating the good from the poor students. This study is part of a larger study involving a school in Connecticut and Central High School in Cincinnati. The results we have from Central indicate that an aptitude test battery for Lithographic Plate Maker gives good prediction of success in the eleventh grade printing curriculum for 55 students receiving lithographic training.

There are more ambitious studies that will provide data on validity extension. One of these is being done by Dr. Pucel, the chairman of this session. His study involves use of the GATB and other instruments to determine whether any of these instruments can differentiate groups of students applying for different vocational-technical curricula in the area vocational-technical schools of Minnesota. Both school and occupational criteria are being obtained on a longitudinal basis. We in the employment service look at this as a very significant study which could have wide implications for further research and use in the schools.

If any of you are in a position to obtain the necessary data for studies of this kind, let me encourage you to do so. It will make the GATB more useful in the schools and will add to knowledge in this important, but little studied, area of validity extension.

Moderator Variables

Recently, we have done some research involving moderator variables. A moderator variable is one that influences the degree and kind of relationship between other variables. For example, a given test may be a better predictor of criterion performances for men than women, or a better predictor for applicants from a lower than for applicants from a higher socioeconomic level. In these examples sex and socioeconomic level are known as moderator variables, since they moderate the validity of the test.

Some time ago the U. S. Employment Service did some research on the question of whether "age" was acting as a moderator variable in validity studies on specific occupations (Droege, 1967). We knew from previous studies on adults that scores on most aptitudes decline with age, but we did not know what effect the decline had on validity of prediction. Our approach to this question was to select for further analysis 11 longitudinal occupational validation studies with a wide age range represented in the samples. For each sample we obtained two sets of scores. One set consisted of the scores on the 9 GATB aptitudes. The other set consisted of these scores adjusted for decline with age, done in such a way that the average adjusted score was the same for all age groups. Some significant differences in validities were found but the differences between the validities of unadjusted and age-adjusted scores tended to be small.

We are now planning similar analyses using a measure of cultural exposure as a moderator variable. We hope that this analysis will help us to determine to what extent the limited cultural exposure of many of our applicants should be a factor in interpreting test results.

In conclusion, some of the new approaches we have used in validating the GATB have begun to pay off. And we expect that as these new techniques demonstrate their usefulness, they will become standard parts of our research program.

THE EVALUATION SYSTEM FOR THE AMERICAN INDUSTRY SECONDARY SCHOOL COURSES

Introduction

Throughout the last three years the American Industry Project has been developing and field testing a secondary school curriculum which has as its central purpose the study of industry. An evaluation system was designed and refined in concert with the curriculum development activities to provide data for the various curriculum design decisions and to measure the effects of the study of American Industry. This evaluation system is described in later sections of this paper. The following section gives a brief overview of the American Industry rationale for those who have not been exposed to it before. If the reader has already heard or read this material, he may desire to page directly to the section entitled "Evaluation of American Industry Courses." This section gives the rationale for the evaluation system developed for the Project and outlines the types of data collected. The concluding part of this paper presents several studies based on selected portions of the information gathered.

Rationale for the Study of American Industry

During the 1962-63 school year, several professors at Stout State University initiated a series of meetings to discuss their concerns related to the content and scope of the existing industrial arts curriculum. Out of these discussions grew the rationale for the study of American Industry. Embodied in this rationale were four basic tenets related to the source and nature of content to be studied.

The first tenet identified Industry as the source of content. Industry was subsequently defined as "an institution in our society which, intending to make a monetary profit, applies knowledge and utilizes natural and human resources to produce goods or services to meet the needs of man." Obviously this definition encompasses a wide variety of business enterprises. To study each one would be impossible. However, the discussion group noted a number of similarities among all enterprises. For example, merchants, automotive dealers, manufacturers, contractors, service station owners, and farmers have to apply management techniques in their businesses.

The trend to the study of concepts in other curriculum areas reinforced the conclusion that a diverse set of enterprises could be reduced to a set of meaningful concepts. In addition, Bruner's work (1960) indicated that a discipline has an underlying structure which interrelates the basic ideas found in the discipline and lends considerable explanatory power to its postulates, concepts, and principles. On this basis, the decision was made to analyze a variety of industries,[1] to isolate the concepts common to them, and to identify the relationships among the concepts. After considerable

---

[1]When used in this manner, industry refers to a group of enterprises or businesses engaged in producing or servicing the same type of product such as the auto industry or the TV repair industry. American Industry refers to the institution identified in the Project's definition of Industry and includes all industries that exist to make a monetary profit.

study, several hundred contacts with industry and labor leaders, and considerable discussion on the part of the American Industry staff, the concepts and structure depicted in Figure 1 were delineated. The concepts on the inner ball are the ones Industry uses directly to accomplish its goals. The concepts listed in the outer ring identify the environment in which Industry operates. An interaction relationship exists between the concepts on the ball and those in the ring.

Tenets two and three of the four mentioned previously are related to this structure: (2) the study of American Industry will be concerned with the structure of the knowledges of Industry, and (3) this study will also concentrate on the concepts of Industry. The remaining tenet stresses the inclusion of problem solving experiences in the American Industry curriculum.[2]

Three secondary school courses have been designed on the basis of this rationale and the structure. The first course, Level I, introduces the student to the basic concepts of industry listed in Figure 1 and gives him experience using these concepts to solve industrial problems. In the second course, Level II, the student goes into greater depth in each of the concept areas and becomes more involved with the actual flow of activities and events in an industry. At this level, he also encounters more sophisticated industrial problems. Level III provides the student an opportunity for individual study and an in-depth problem solving experience. He is encouraged to select a suitable problem and investigate it in terms of the conceptual structure of industry.

All three levels are viewed as transitional subjects between general and vocational education. Their goal is to provide experiences that assist the individual to make wise vocational choices, to understand his chosen role in our complex industrial society, and to be a productive member of society. Only the first level is viewed as a required course. After this point a student may decide to continue in the American Industry sequence or elect to take any of the other programs available in his school.

---

[2] A more detailed description of the American Industry Project's rationale may be found in 'The Establishment of American Industry as a Transitional Subject Between General and Vocational Education" authored by Wesley Face and Eugene Flug, Co-Directors of the American Industry Project.

A CONCEPTUAL STRUCTURE OF THE KNOWLEDGES NECESSARY TO UNDERSTAND AMERICAN INDUSTRY

672C

Evaluation of the American Industry Courses

Purposes of the Evaluation

Will students have significantly different competencies after studying this course? Can eighth grade students read this material? Should this lesson contain more detail? Why was this activity successful while the first one failed? These and similar questions challenge curriculum developers and evaluators. And, the American Industry Project was not unique in this respect in that it had to answer the same questions.

The first question may be answered by measures of terminal behaviors in experimental, quasi-experimental, or time-series experimental studies. However, the other questions listed require additional information. Most of this information is related to the inputs into the instructional setting and the teaching-learning activities that transpire in this same setting. In many ways this information is analogous to the data required to make scientific management decisions.

As the Project began the research specialist identified several questions germane to the evaluation. Most of these were associated with the outcomes of the study of American Industry such as the ability to think conceptually and solve problems. However, after the data for the first term had been analyzed, a mixture of positive and negative results caused a further examination of the scope of the evaluation. Additional questions which emphasized the gathering of data pertaining to the factors that influenced the terminal behaviors of students were defined. Then the evaluation system was revised to provide the means to collect the information required to answer these questions. Not only did these additional data assist in illuminating the critical factors related to the end results but they helped to identify problems in time to take corrective action prior to the end of the school term.

The complete evaluation system presently employed by the Project is described in the next section. Remember that it was developed to assess the outcomes of the study of a new curriculum and to provide management information to the Project staff. Each instrument and data gathering device was selected and designed to provide the information required for decision making and answering the critical questions associated with the development and teaching of these courses.

It is impossible to overemphasize the importance of distilling the critical questions and identifying the essential decisions as the basis for the design of an evaluation system. Even if it proves difficult to obtain information for some of them, this very fact will stimulate the researcher to further development and encourage creative ways to garner the needed data.

Evaluation Domains and Procedures

Early in the design of the evaluation system three domains were defined in which to collect data. The ingredients domain encompasses all of the inputs into the learning situation. Examples of these inputs are the quality of the instructional materials, abilities and interests of the students, characteristics of the participating teachers, and the intellectual climate of the school and the community.

As a course is being taught, a number of instructional processes are applied to and interact with these inputs. Students are exposed to instructional media, activity sheets, and booklets in the American Industry course. Teachers are exposed to new materials and ideas and their associates become aware of a new curriculum. All of these on-going actions and activities are embraced in the processes domain. This domain can generate a continuous flow of vital information during the time the course is in progress. However, it requires systematic monitoring and a relatively rapid feedback process.

The third domain consists of the products or outcomes of the study of American Industry. It is concerned with the nature of the student at the end of the course, impressions of the teachers, reactions by administrators and staff members at the school, and opinions of the parents.

Figure 2 gives a graphic presentation of these domains and illustrates the relationship between them. Examples of data collection procedures and instruments for each domain are presented in the next section.

The evaluation domains identify the sources of information in the evaluation. Equally important are the types of data collected and the collection schedule. Figure 3 depicts the strategy utilized in developing and evaluating learning expedients. The ball at the left symbolizes the basic role the Project's rationale plays in each action and decision. Initial tryouts of materials, learning activities, or instructional methods probably will not provide optimum solutions; however, they will provide feedback for further refinements. These results and relationships are indicated by the spiral line around the solution axis and the decreasing distance between the two with each succeeding spiral. This strategy may be applied to an entire course, a unit in the course, or a sub-part of the unit. Its application will depend on the data required by the researcher.

The relationships of the linear distance traversed along the solution axis during each succeeding spiral is denoted by $X>Y>Z$ in Figure 3. In other words, progress becomes more difficult with each successive spiral. The first trial identifies obvious areas in which improvements can be made. As these changes are made, smaller and more subtle problems come to the forefront.

EVALUATION DOMAINS IN THE AMERICAN INDUSTRY PROJECT

Figure 2

Figure 3

Research and Development Strategy[3]

[3]The Research Specialist is indebted to Dr. Martin I. Taft of the Department of Mechanical Engineering at UCLA for the idea for this graphic representation of the Project's research and development strategy.

Each spiral along the solution axis contains five distinct segments that represent specific steps in the development and evaluation of a curriculum or a sub-part of it. The first step is to state the objectives for the course or segment of instruction in as lucid terms as possible. Once the objectives are stated learning expedients can be selected or developed to meet them. At this point the learning expedients are ready for a tryout in an instructional situation. This may be in a regular classroom or a special group of students may be selected on which to run the first trials. Data are collected prior to, during, and at the end of the tryout to provide the basis for the evaluation. The domains noted previously identify areas in which to collect information. Interpretation of the products data is made in relation to the ingredients and processes data as well as in comparison with the performance of the control group. A graphic illustration of a specific spiral is given in Figure 4. The ring which envelopes the spiral connotes the role of the ingredients and processes data in evaluating the outcomes of the test of the learning expedients.

Upon completion of the evaluation, the researcher must decide whether the objectives were met and if not, the reason(s) for not attaining them. If the decision is made to continue into another cycle, the same five steps would be employed. This process would be continued until a satisfactory level of achievement is reached. "Satisfactory" as used in this context does not imply that the instructional materials are perfect, rather, it means that in relation to the other elements of instruction being developed the one under consideration has been improved to the point where it would be more efficient to work with another one.

To the degree time and resources permit, a variety of measurements should be made during each evaluation. Each type of measurement has its biases. Use of several will hopefully isolate the factual information from the random error and bias factors present in specific types of measurement. For instance, objective tests allow the evaluator to sample a prescribed set of behaviors but they penalize the nonverbal student. Whereas essay tests allow the student to freely express himself, they suffer from the lack of scope in the behaviors sampled and the objectivity of the scoring process. Observation of students in the "normal" classroom setting and engaging them in discussion can also help to assess their competencies, but this procedure in itself alters the "normal" classroom situation and is open to rater bias. However, use of the data from all three sources in the analysis can help to identify the true outcomes.

When using this approach care must be taken to avoid overloading any one person with evaluation forms. Students could be inundated with tests and rating sheets. Since there are a variety of sources of information, this situation usually can be avoided by some careful planning. The American Industry Project, for example, obtains information from the participating teachers, students, guidance counselors, administrators, the Project's supervisor of participating teachers, and the instructional materials. Where possible, simple forms are designed to facilitate responding and direct duplication of data is avoided with the exception of some collected to use in determining the reliability of the measuring techniques.

Figure 4

A Specific Research and Development Spiral

The following are some examples of the data contributed to the Project and their source. Individual lessons and other instructional materials are rated by the participating teacher. Rating sheets are placed after each lesson in the instructor's guides and accompany the instructional media. These forms require two to three minutes to complete and provide useful information on the structure, contents, and utility of the material rated. Also, the placement of the rating sheets provides systematic feedback which is important in the evaluation. The time intervals between feedback provide an indication of the progress of the course. Workshops and the end of the year report also provide the teachers with opportunities to communicate their questions, problems, and opinions of the courses.

Students express their opinions of American Industry courses on two forms. A free response opinionnaire is completed at the end of the course. In this form, the student lists the classes he likes and dislikes and the reason(s) for his listing. In addition, he is asked to list his likes and dislikes related to the American Industry course. Several statements in the rating form employed to evaluate the written materials focus on the students' opinions of the quality and utility of the instructional materials. The students' knowledge of industry and problem solving skills are assessed by means of the Project's achievement test. This test has objective and essay portions. Their interests and activities are recorded on the Project's Student Questionnaire which is comprised of items selected from Project TALENT'S Student Information Blank (1964).

Guidance counselors provide ability and reading test scores to the Project. Administrators complete a form which describes the resources available in their schools and the curriculum offerings. They also comment on their school's relationship with the Project and raise any questions they may have.

The supervisor of participating teachers attempts to visit each participating teacher once a month while school is in session. During these visits he records the progress and problems identified by the participating teacher. He also notes the activities of the classes and interviews individual students.

A more subtle but very appropriate source of information is the condition of the instructional material when it is returned to the Project. Materials that have been used will show signs of wear, pencil or pen marks, and smudges. For example, several of the Project's overhead transparencies have a place to write in comments as the class discussion progresses. A clean transparency and mask indicate that it was not used in the manner it was designed for. Booklets with clean covers and tight bindings suggest that they were not opened very frequently.

The data collected are channeled to the research specialist for analysis and interpretation. During this stage of the evaluation, several comparisons are completed. Comparisons are made between the students in the American Industry classes and the students in the control groups. In as many schools as feasible, experimental designs are used for the evaluation. However, in some situations this is not possible and quasi-experimental designs have to be substituted.

Data from American Industry classes during previous school terms are also used in the analysis to identify any improvement or deterioration in performance over the given time period. These changes can then be correlated with revisions made in the courses, instructional materials, and teaching methods.

The effects or products of the study of American Industry can also be associated with the appropriate ingredients and processes. An example of the interrelationship between the three domains is provided by the evaluation of the student booklets used in American Industry classes. The following data are collected:

Ingredients	Processes	Products
Reading level of each booklet (Dale-Chall formula)	Teacher descriptions of uses made of the booklets (Feedback form)	Student opinions on reading level and content (Reading form)
Reading ability of the students (Reading test)	Supervisor's of Participating Teachers observations of the classroom use of the booklets	Teacher opinions of the utility of the booklets (Feedback form)
General ability of the students	Signs of wear and usage on the booklets	Student achievement

If student achievement is low in an area thoroughly discussed in the booklets, the possible cause or causes can be defined and evaluated. For instance, the students may not be able to read the material. This can be assessed by comparing the reading level of the material, the students' reading abilities, and their opinion of the readability of the material. In like manner, other causes of variations in performance may be determined.

Most of this information is very important to the curriculum specialist. In some instances it will verify his decisions--in others it will point out new directions or problem areas which need attention. Hence, it is important that the researcher work closely with the curriculum developer and that they comprehend each other's problems. On the American Industry Project this has been accomplished with substantial benefits to both functions.

Selected Evaluation Procedures, Instruments, and Outcomes

Previous pages have described the general nature and purpose of the evaluation system developed for the American Industry Project. Some of the evaluation procedures, data gathering instruments, and results will now be presented to illustrate how the system works and the type of outputs generated by it. This is not a complete enumeration, rather, it is a sample to demonstrate the characteristics of the system and the types of data collected. A full report on the research carried out by the Project will not be available until late in 1969.

Organization of the Instructor's Guide for Level I

One of the first problems encountered by the curriculum specialist was the design of a functional instructor's guide. This guide had to be flexible enough to be employed in a variety of industrial arts laboratories by industrial arts teachers with diverse backgrounds. At the same time, it had to embody the American Industry Project's rationale and take into account the nature of the learning process.

Three separate aspects were involved in designing the guide: (1) design of the format, (2) selection of the content, and (3) specification of the sequence of material. All three of these elements are discussed in detail in a paper by Richard Gebhart (1968). Thus, this paper will review them to the degree necessary to make the data gathering procedures and the resulting data meaningful.

The lesson format evolved over a three year period of experimentation with various forms. In the present form, each lesson consists of objectives, scope of the lesson, references, and content outline. The content portion of the lesson is written in narrative form. Material that is to be discussed or covered in discovery mode is set off in parentheses. Lessons vary in detail depending upon the teachers' backgrounds in the area involved. For example, the marketing lessons were written in a very detailed fashion while the processes lessons contained concise outlines. Another feature of the content portion of the lesson was the provision for utilizing instructional media. Instructions for using, the narration, and the discussion questions were placed at the point in the lesson where the instructional media was to be used.

Evidence on the utility and effectiveness of this lesson format and the design of the lesson content is presented in Table 1. The two items directly related to the format of the lessons in the guide, numbers seventeen and thirty-nine indicate that the format is functional and easy to follow. There is evidence that the teachers had some problems interpreting the parentheses (item twenty-two).

Table 1

Responses on the 1967-68 End of Year Report
Related to Lesson Format and Content

Item No.[4]	Statement	Responses					
		SD	D	U	A	SA	NR
8.	I could not understand the material in the Instructor's Guide.....	9	3	4	1		
17.	The format of the guide is easy to follow.....			1	10	6	
21.	The narrative in the lessons did not give enough content.....	4	5	5	3		
22.	I could tell by the narrative in the lessons when I was to use discussion or other student involvement.....		2	5	3	2	
33.	The lessons did not go into enough depth.....	6	7	3	1		
34.	The instructional media were effectively correlated with the lessons.....		1	2	12	2	
39.	The format of the lessons is functional..			1	12	4	

Key to Responses: SD = Strongly Disagree, D = Disagree, U = Uncertain, A = Agree, SA = Strongly Agree, NR = No Response

[4] Item number in the End of Year Report.

Most of the teachers felt that the lessons went into sufficient depth and provided enough information (items twenty-one and thirty-three). However, there were enough uncertain and agree responses on item twenty-one to stimulate further investigation of specific weaknesses. As a result, additional instructional materials were mailed to the teachers and workshop presentations were selected to provide more content background for the participating teachers. About seventy per cent of the teachers responded that they could understand the material in the guide (item eight). The actions mentioned above should also help the thirty per cent who had problems comprehending some or all of the guide.

Over eighty per cent of the participating teachers had little or no trouble integrating the instructional media with the lessons during their instruction (item thirty-four). This information substantiated the decision to include the scripts and directions for the utilization of the media at the point in the instructional sequence at which they were to be used.

A more difficult and intriguing problem was posed by the question of the best sequence in which to study the concepts and structure of industry. Psychological research suggested that a cyclical presentation of the subject matter would be most efficient. Through encounter with learning experiences related to a concept in a variety of situations and contexts the student has a chance to periodically refresh his memory and embellish this concept of the material being studied. To illustrate this point, consider the cyclical study of the concept of communication. In his first contact with the materials and activities related to this concept, the student will have only a slight knowledge of the other concepts in the structure of industry. Hence, the concept of communication formed by this student will be relatively simple and will be connected to only a few industrial referents. However, as the study of American Industry progresses throughout the school year, communication in its various forms will be revisited on several occasions. By means of this sequence, the student will experience communication activities in such areas as planning, production, management, procurement, and marketing. Thus, instead of forming a unidimensional concept, the student's concept of communication will have n dimensions where n should at least approach twelve and may exceed this number.

Two techniques developed by Gagne' (1965) were employed to determine the information and sequence of information to present in each cycle. Starting with the problem solving and knowledge of industry objectives established for the first course, the curriculum specialist and the research specialist determined the knowledges, concepts, and skills required to attain these objectives. The analysis proceeded from the two broad objectives back to the characteristics of the incoming students. Care was taken to identify logical and complete sequences of learning. Figure 5 presents a very brief summary of the taxonomical breakdown that resulted.

Some Beginning Competencies - Typical 8th Grade Students

1. Reading and Communication Skills
2. Mathematics Skills
3. Normal Psychomotor Development
4. Exposure to Local Enterprises
5. Experience in Handling and Spending Money
6. Etc.

Figure 5

After this analysis had been completed, the course outline was established in final form. (Figure 6 gives the Level I course outline and identifies the cycles in red.) Lesson themes were delineated and specific skills and information were allocated to the lessons on the basis of the analysis discussed in the previous paragraph. The information in the lessons included the appropriate interrelationships among the concepts. These interrelationships are vital to the study of the complete structure of industry. Writing assignments were then made.

Although care had been taken in planning and analyzing the content prior to writing, there was still a question as to the structure and content of the output. With several writers and pauses to complete other jobs there was a distinct possibility that some elements had been left out or placed in improper perspective. To evaluate this possibility, a lesson analysis procedure was developed by the research specialist.

An analysis matrix was developed with numerical labels for each concept, the attributes of the definition of industry, and the basic terms on the horizontal axis. The vertical axis in part one of the analysis sheet listed the major portions of the lesson. In the second part, which was concerned with the interrelationships established with other concepts, the vertical axis had the same categories as the horizontal axis.

Table 2 presents the concepts, attributes, basic terms and the numerical labels used in the analysis. Output from an analysis of the first communication lesson in Unit III is given in Table 3. Figures within the matrix represent levels in the taxonomy for the cognitive domain developed by Bloom. The left-hand column identifies in order the low taxonomy level present in the introduction, the high taxonomy level present, the number of instances at each taxonomy level, any introductory activity utilized, and the industrial problems included. The same sequence is utilized for the body and summary portions of the first part of the analysis.

A further explanation would probably be helpful in conveying the meaning of "instances" as employed within the context of this analysis. By instance is meant a unitary bit of instruction which can stand by itself. Consider, for example, a specific illustration of communication in industry such as producing too few parts because of faulty instructions. This provides an "instance" to discuss in introducing the study of communication. As soon as the class directs its attention to another illustration or topic, a new "instance" is encountered.

A review of the output in Table 3, discloses that the introduction contained one instance at the first level in the cognitive taxonomy related to communication. In addition, there is one reference to industry indicated by the 1 in column 40. The body of the lesson starts at level one in the cognitive taxonomy and moves into the second level. In other words, the students are required to interpret and translate material related to instruction. Also, the attributes of communication are mentioned (note the 1 in the column labeled 50).

Finally, in the summary the students review the material and the teacher tests their concept of communication by asking them to apply it to a unique situation. This "test" is indicated by the three at the high taxonomy level.

LEVEL I - AMERICAN INDUSTRY COURSE OUTLINE

TEACHER DIRECTED

	Units and Features	Unit Theme
Unit I	Industry Today 1. Introduction to American industry 2. Resources of industry 3. The environment of industry 4. The basic parts of industry	- Let's analyze industry.
Unit II	The Evolution of Industry 1. The needs of man 2. A search for greater productivity 3. Some effects of man's quest for productivity	- The needs of man and why he progressed.
Unit III	Organizing an Enterprise 1. Communication 2. Research 3. Management 4. Finance 5. Property 6. Energy	- Let's start a business.
Unit IV	Operating an Enterprise 1. Relationships 2. Procurement 3. Materials 4. Processes 5. Production	- Let's produce using modern production methods.
Unit V	Distributing Products and Services 1. Marketing 2. Transportation	- Why does a product sell?
Unit VI	The Future of Industry 1. State of the art 2. Reasons for change 3. Future expectations	- Where do we go from here?
Unit VII	The Students' Business Venture 1. Development 2. Fabrication 3. Marketing 4. Evaluation	- The students organize, produce, and sell.

Table 3

Lesson Analysis Output

A look at the interrelationships matrix in the bottom portion of Table 3 reveals that the concept of communication was related to industry. During Unit I the students acquired a concept of industry, now, in Unit III they start to study the major concepts encompassed in the Project's structure of industry. Hence, this interrelationship is logical and is in proper sequence to demonstrate the role of communication in industry.

All of the lessons in the Level I instructor's guide have been analyzed with this procedure. In addition to the output for each lesson, the data cards can be sorted to provide a listing of each lesson in which a concept appears. Placing these in the sequence in which the lessons appear in the guide reveals the sequence and distribution of the instructional materials related to each concept. These can then be checked against the original design of the guide. For instance, on a previous page it was noted that the guide would be written to present materials related to communication at several points within the course. One example given was the role of communication in advertising, thus, one should find this noted in the analysis for one or more of the marketing lessons. Indeed, the analysis for lesson four in Unit IV indicates that the marketing concept, number 9, is interrelated to the communications concept, number 1, as shown in the portion of the interrelationships matrix reproduced below.

INTERRELATIONSHIPS MATRIX

	CONCEPTS.							BALL									RING							ATTRIBUTES						
CONCEPTS ATTRIB	1	2	4	5	6	7	8	9	10	11	12	13	14	20	21	22	23	24	40	41	42	43	44	45	50	51	60	61
09 LOW TAX LEVEL	1	0	2	0	2	0	0	0	0	0	2	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0
09 HI TAX LEVEL	5	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	4	0	0	0	0	0
09 NO AT LOW TAX	1	0	1	0	1	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1	2	0	0	0	0
09 NO AT HI TAX	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

Interpretation of the numbers in this matrix indicates that students study the relationship of communication to advertising starting at the first level in the taxonomy and progress to the synthesis level (level five). This synthesis is attained through the actual design and production of advertising.

The data from this analysis have been helpful in making minor revisions in the guide during the past year. From this experience, it was also evident that this information will be very useful when a more complete study and revisions of the guide are made.

Up to this point the techniques for structuring instructional materials and reviewing the characteristics of the completed materials have been described; however, one of the most critical tests remains--the teachers' evaluation of their effectiveness in the classroom. To acquire this information, feedback sheets were placed at the end of each lesson. Item eight in this form asked the teachers to indicate if the lesson rated fit into the overall instructional sequence. There were 571 responses to this item with 547 of these responses indicating that the lesson rated fit into the instructional sequence. Eight responses evaluated a lesson as not being in proper sequence. And, on sixteen sheets this item was left blank. Item five in the feedback form provides information on the structure of the lessons. Only eleven of the 564 responses to this item said that the lesson was not logically structured. Thus, the data provide conclusive evidence of the logical structure and sequence built into the instructional materials.

Whereas the instructional materials discussed in this section had to be constructed on the basis of techniques that had not had extensive use or formal evaluation, the data collected during the development and tryout phases provided an essential source of information for evaluating the quality of these materials. In addition, these data can also be used to assess the validity of the procedures employed in developing the instructional materials. The operating characteristics of the data collection procedures provide evidence on their efficiency and utility. Thus, relevant information exists for further revisions of the materials, the procedures used in constructing them are substantiated by empirical evidence, and the characteristics of the data gathering system are known.

Products of the Study of American Industry--Student Outcomes

Two aspects of the evaluation of student outcomes will be reviewed in the ensuing pages. First, a brief description of the Project's achievement test and a general overview of the performance of the experimental and control groups on the test will be given. Second, selected attitudes, interests, and opinions of a sample of the students involved in the evaluation will be summarized and discussed.

Since the American Industry courses were based on a unique set of concepts and structure of the knowledges of industry, an achievement test had to be constructed to measure these constructs and content. As the specifications for the test were distilled the decision was made to limit the time required to complete this instrument to approximately fifty minutes. This was done to reduce the amount of time the students spent completing evaluation forms and to deter an overemphasis on one evaluation technique. If the group of students in the evaluation had been larger, tests could have been made for each concept area and administered to sub-samples of the group.

The basic task in writing the test was one of devising items that would efficiently sample behaviors critical to the objectives of the American Industry courses. Since the essential aspects of these courses were the study of concepts, the solving of problems, and the study of structure, the majority of the items in the test were related to one or more of these elements. In addition, some items at the knowledge level were included to assess the validity of the taxonomical structure of the levels of learning posited in Figure 5.

Items were written for each conceptual area and problems were defined which would cut across several conceptual areas in order to test the knowledge of the interrelationships of the concepts. In addition, several items were written which could be answered on the basis of "pure" conceptual thinking without recourse to the concepts of industry. Approximately eighty per cent of the items in the final form of the test were concerned with applying the concepts and structure of industry to problems or situations in industry. Five per cent tested conceptual thinking and the remaining fifteen per cent assessed factual knowledge.

The items in the objective portion of the test are four choice multiple-choice questions. In most instances a problem situation provides the basis for the item stems. When possible the alternative responses for an item were constructed to provide information on the responder's cognitive structure or lack of knowledge. An illustration of this is given by the test item reproduced in Table 4. In this problem, the distractors disclose whether the student has information on the cost, insulative qualities, and strength of common materials. If, for example, a student thought that materials were selected for their strength, he would select D as the appropriate choice.

The response distributions for all of the American Industry and control group students on this item are:

Response	American Industry	Control
A	7.3%	11.4%
B	74.1%	57.0%
C	13.9%	21.2%
D	4.7%	10.4%

These data indicate that the control group students are more likely to base their choices on the more salient characteristics of materials.

Comparisons can also be made between a control group and the classes taught by a specific teacher to determine if a particular bias is inherent in his instruction. For example, last year it was found that the students in one school were prone to select the distractor based on the finance concept when it was included in an item. This fact was communicated back to the teacher. In addition, this information suggested a need for problem solving exercises to develop the students' ability to deal with several relevant factors when solving a problem.

Table 4

CATEGORIZATION FORM FOR EVALUATION ITEMS

Directions: Fields are defined by capital letters, card columns by numbers reproduced on the master sheet. Numbers or signs written on this form are to be punched in the columns designated under the blank.

A. Item number; b 0 4 5 0
1 2 3 4 5

Concepts evaluated: B. First order: b 1 2. 0 0 0
6 7 8 9 10 11

C. Second order: b 0 1. 0 0 0
12 13 14 15 16 17

D. Third order: b 0 8. 0 0 0
18 19 20 21 22 23

E. Fourth order: b 0 4. 0 0 0
24 25 26 27 28 29

F. Relative Emphasis on concept order: b 0 1
30 31 32

G. Taxonomy level: b 4. 0 0 0
33 34 35 36 37

H. Type of item b 0 1
38 39 40

I. Difficulty: b 6 5. 6 (%)
41 42 43 44

J. Discrimination: b . 5 3 6 1
45 46 47 48 49

Author of item: _____

Why would mahogany paneling be used in the office of the president of an enterprise?

A. To reduce building costs
*B. To communicate his status
C. To improve the insulation of the office
D. To strengthen the office walls

Each test item was written on the form presented in Figure 4. The information recorded in the first portion of the form identifies the concept or concepts related to the question. In this example the concepts are materials (12), communication (1), relationships (8), and finance (4). Each of these would have an equal bearing on the solution; thus, the relative emphasis is rated as equal (1).

This item requires analysis of the situation given in the stem. Therefore, it is placed at level four in the cognitive taxonomy. Naturally, this assumes that the students have not seen this problem before. To insure this, the Project maintains the achievement test as a secure test and does not distribute it with the instructional materials or release it for review. Item type is listed as multiple-choice (1). The numbers representing the various types of items are arbitrarily assigned labels.

Difficulty and discrimination values accrued as the item was administered to various groups. Whenever possible, test items were tried out on a pilot group prior to their use in the formal evaluation. After an item was placed in the achievement test, information on its operating characteristics was obtained from the Generalized Item and Test Analysis Program (GITAP) developed by Dr. Baker at the University of Wisconsin (1966). A sample of the output from this program for the item in Table 4 is reproduced below.

ITMNO	CHOICE	WT	NR	DIFFICULTY	R	X50	BETA
36	1	0	2	.0444	-.1729	-9.8411	-.1755
36	2	1	29	.6444	.5408	-.6802	.6430
36	3	0	10	.2222	-.5728	-1.3305	-.6987
36	4	0	4	.0889	-.0900	-14.9671	-.0903

Starting at the left, the first three columns identify the item, the response choices, and the weight given to each response. (A weight of 1 is given to the correct response in this example.) The next two columns list the number of students selecting each response and the proportion represented by these numbers. Column five gives the biserial item-criterion correlation. In this analysis, the test score is the criterion. The last two columns present the parameters for the item characteristics curve (Baker, 1964). X_{50} identifies the point on the criterion scale, distribution of total test scores, at which half of the people with the given criterion score selected the response under consideration. These values are in the standard deviation units of the total test score distribution. Hence, fifty per cent of the people with test scores .68 standard deviation units below the mean test score would select the correct choice for this item. Beta gives an approximate value of the scope of the item characteristics curve at X_{50} and indicates the discriminating power of the item. For this administration of the item, these parameters indicate that the item is relatively easy and has positive discrimination.

GITAP also calculates test reliability utilizing the Hoyt analysis of variance method. Reliabilities for the Project's achievement test calculated on the basis of test results from individual American Industry classes range from .74 to .91. The median value of these reliabilities is .82. No doubt these reliabilities could be improved by discarding the items which usually discriminate poorly. However, the decision to keep or discard has not been made on this basis alone. Equally important was the nature of the item and the information it contributed to the evaluation. In other words, if there was no observable defect in the item and it provided important data, the item was kept in the test and questions were raised concerning the reasons for the poor results on this item. Most of these questions lead to a review of the ingredients and processes information related to the output being studied.

Content validity of the achievement test was relatively easy to establish. The item form shown in Figure 4 clearly defines the concept areas and interrelations measured by each item. And, the taxonomy level is identified. With this information items can be selected to evaluate all of the concepts and a portion of the interrelationships in the Project's structure of Industry. Determination of construct and criterion-related validity will have to await further data collection.

A general analysis of the test results during the 1967-68 school year disclosed the following outcomes for the eighteen and thirty-six week courses.

Length of Course	Outcomes of Comparisons: American Industry vs. Control Groups			
	A.I. Lower	Same	A.I. Better--Not Significant	A.I. Significantly Better, $P < .05$
18 Week Course		5	3	3
36 Week Course	1	0	3	4

As could be expected, the thirty-six week courses produce proportionally more significant results than the shorter course. Likewise, the longer course has proportionately more comparisons that favor American Industry but do not attain significance (differences between test means in this category range from 1.5 - 4 points). In contrast, the eighteen week course has several comparisons in which the means of the experimental and control groups are for all practical purposes the same (differences in this category are less than one point). One

American Industry class achieved less than the control group ($\bar{X}_E - \bar{X}_C = -1.5$). However, this comparison was made in a quasi-experimental design in which the control group had higher ability scores.

More detailed analyses may change the composition of the "A.I. Lower," "Same," and "A.I. Better" categories. However, there should be little if any change in the "Significant" category. At the present time, the data collected in the evaluation are being placed on a disk file for efficient retrieval and more sophisticated analyses. These analyses should produce a more definitive picture of the effects of the study of American Industry and the causes of these effects.

The ensuing paragraphs present and discuss responses on a student opinionnaire completed at the end of the school term. Some interesting differences appear and the data also provide the basis for establishing some correlates between performance on the achievement test and the learning activities encountered by the students.

At the end of the 1967-63 school year students in a sample of the American Industry and control classes, were asked to respond to the forty statements listed in Tables 5 and 6. Five responses were designated on the response sheet: "strongly disagree," "disagree," "undecided," "agree," and "strongly agree." In Tables 5 and 6 these responses are represented by SD, D, U, A, and SA respectively. The sixth heading, NR, indicates the number not responding.

Table 5 gives a summary of the responses made by the American Industry students who completed the opinionnaire. Table 6 presents a similar summary for students who did not take American Industry. In both tables the first figure in each column gives the total number of students marking the given response. The second figure in parentheses, lists the per cent of the group that marked the response.

Data in these tables do not represent all of the students encompassed in the Project's evaluation. A random sample of schools was selected in order to reduce the total time required to complete evaluation instruments in the participating centers. Also, the variation in evaluation designs within the selected schools resulted in the difference in number between the American Industry and control groups.

The analyses reported in subsequent paragraphs are based on the data in Tables 5 and 6. As noted above, these data are summed over several schools and grade levels. In addition, it was assumed that the level of measurement represented by the response area between SD and SA was ordinal. Hence, statistical tests were selected to evaluate ordinal data and the analysis in general was kept at a gross level. These are two important constraints but they do not reduce the value of the data in answering certain important questions as will be pointed out later.

Four general areas were designated within which to construct items for the opinionnaire. These areas were occupational behaviors, attitude toward

industry, interest in industry, and class activities. Each of these areas was selected because it would provide relevant data. The first three pertain to general outcomes of the course. Tha last category, class activities, concerns specific opinions related to the nature of industry and the structure of the American Industry course. It was included to assess the effects of various learning conditions and activities built into the course.

The areas and the numbers of the items encompassed in each are listed below:

Occupational Behaviors	Attitude Toward Industry	Interest In Industry	Class Activities
8	4	1	3
13	7	2	11
35	9	5	12
38	10	6	16
39	14	15	17
	18	20	23
	19	22	24
	21	29	26
	25	34	27
	28		32
	30		37
	31		
	33		
	36		
	40		

Two statistical comparisons were made using the data that appear in Tables 5 and 6. First, chi square values were calculated for the American Industry and control group data on each item. Next, the two groups were compared on the complete set of responses in each category.

The values obtained for the chi square statistic disclosed significant differences, $P<.05$, on ten items. Further investigation of these items revealed that in each case the response patterns favored the American Industry students. The significant items and the categories in which they

are located are listed below.

A. Occupational behaviors

Item 13. I will probably work in industry.

Item 38. There are many job opportunities in industry that I did not know about before taking this class.

B. Attitude toward industry

Item 21. Industry has little influence on me.

Item 25. Industry charges too much for its products.

Item 28. Industry offers a variety of job opportunities.

Item 31. I have greater appreciation for industry after studying it in class.

Item 36. Products produced by industry are usually of low quality.

Item 40. Industry provides an opportunity for people to develop their abilities.

C. Interest in industry

Item 6. I find it interesting to look at the designs used used in the products sold in local stores.

D. Class activities

Item 26. I had a chance in this class to develop some of my ideas for products.

Of the four categories, attitudes toward industry and occupational behaviors apparently are influenced most strongly by the study of American Industry. However, the significant items in the remaining two categories also shed light on the outcomes of the study of American Industry. For instance, the responses on item 26 indicate that the American Industry students had a greater opportunity to solve problems in class.

The second analysis entailed a comparison of the total set of responses within each category. For this analysis, the responses SD, D, U, A, and SA were given the values 1, 2, 3, 4, and 5 with five being assigned to the most favorable response. The mean response was then calculated for each group on each item. Comparisons were made on each item to determine which group responded more favorably. In addition, the response patterns were checked to determine what effect a change in scale values would have on the results. In other words, if the extreme responses received more weight, what would happen to the results? These effects were also recorded. Table 7 presents

a summary of these data and the comparisons on individual items.

The exact probability of obtaining the results found in each category was calculated by employing the binomial expansion. Use of this statistic was based on the null hypothesis that the responses of the American Industry and control groups represent the same opinions and behaviors. If this hypothesis is true, then either group should have an equal chance of responding more favorably to any given item in the opinionnaire. To illustrate this, consider the items in the attitude toward industry category. If the conditions in the null hypothesis were true, one would expect that each group would have about the same number of items on which its members responded more favorably. However, in this administration the American Industry group responded more favorably on twelve of the fifteen items. The probability of attaining this result if the null hypothesis were true is less than four chances in a thousand.

Outcomes of two of the analyses remain the same under both scaling procedures. American Industry students exhibit a significantly more favorable attitude toward industry ($P < .004$) and response to the items related to their class activities ($P < .033$).

No significant differences were observed in the remaining two categories. Neither scaling procedure would appear to affect these results. The occupational behavior category contains only five items and, thus, all of the comparisons would have to favor one group in order to attain a significant difference. In the interest in industry category, the comparisons favor the American Industry students, $P < .09$, but do not exceed the commonly accepted significance level of .05.

An analysis of these results reveals several interesting outcomes. The chi square tests identify ten items in which there is a significant difference between the response patterns of the American Industry students and the control groups. All of these differences favor the American Industry students, a fact that is of considerable significance in itself. Moreover, each category in the opinionnaire has one or more items on which a significantly different response pattern was found. This indicates that the study American Industry had some effect in each of these areas.

Analysis of the complete set of individual item comparisons for each category indicated that the American Industry students responded more favorably on the attitude toward industry and class activities items. Hence, it would appear that the American Industry students have had a positive shift in their attitudes toward industry. They also show a more positive attitude toward the opportunities and products associated with industry. No doubt some of this positive effect carries over to item 13 in which a significantly larger number of American Industry students express a preference for working in industry.

The significant difference found in the set of items related to class activities may be of greater interest to the Project staff than to other people since these items are somewhat specific to the design of the American Industry courses. However, few people will probably quarrel with

with the educational relevance of the significant difference found on item 26 which reads "I had a chance in this class to develop some of my ideas for products." These data are germane to the Project's objective to develop the problem solving ability of students. The reader is encouraged to review the results on the remaining items in this category and judge their relevance for his work.

In the area of occupational behaviors, the two items, 13 and 38, which were significantly different in the chi square tests indicate that the study of American Industry increases the students perspectives of the jobs available in industry and their interest in seeking employment in one of them. Both of these effects are important and relevant to the contemporary educational scene.

As noted in the first part of this report, the data in Tables 1 and 2 were obtained from several schools. There was some concern that one or two schools might contribute most to the effects observed. However, review of the results in the individual schools indicated that the statistics for individual classes varied only slightly from those given in Tables 5, 6, and 7.

Other interesting facts of a noncomparative nature can be found in the data reported. Student interest in visiting a business, for example, was very high in both the American Industry and control groups. This would appear to be a good learning activity to satisfy student interests and develop new insights into industry. Also, a large number in both groups, about 75 per cent, were aware of the changing nature of jobs in industry. The reader's interest may delineate further items and data of interest as he reads the tables.

Summary

The evaluation system described in this paper was designed to provide data for evaluation and curriculum decisions. Outcomes of the study of American Industry form the basic criteria for making judgments and decisions. In addition, data related to the characteristics of the ingredients and the learning and instructional processes are collected. This information provides a basis for defining the causes of the outcomes, determining differential effects of the study of American Industry, and isolating the elements that need further study. Specific data collection procedures and instruments were developed to acquire the needed information. Thus, for example, the achievement test was designed to provide data on the essential elements in the Project's rationale instead of selecting items that would maximize differences between the experimental and control groups.

Studies reported in the previous section illustrate the types of data collected. Also they give some evidence of the effects of the study of American Industry. These reports, however, are based on a general analysis of the data. A complete evaluation report will be completed next year.

TABLE 5
UNIT 7 TEST, PART II:
Summary of Responses Made By 1967-68
American Industry Students

STATEMENT	RESPONSE#					
	SD	D	U	A	SA	NR
1. I would like to visit a business to see how it operates.	14(3.3)	17(4.0)	32(7.5)	178(41.7)	175(41.0)	11(2.6)
2. I like to look at products produced by industry . . .	5(1.2)	22(5.2)	72(16.9)	224(52.5)	90(21.1)	14(3.3)
3. All jobs in a business contribute to its profits. . .	19(4.4)	42(9.8)	86(20.1)	155(36.2)	111(26.0)	14(3.3)
4. Industry has interesting jobs to offer.	7(1.6)	25(5.9)	52(12.2)	180(42.2)	148(34.7)	15(3.5)
5. I look at advertising to see what sales appeals are used.	23(5.4)	81(19.0)	111(26.0)	156(36.5)	40(9.4)	16(3.7)
	SD	D	U	A	SA	NR
6. I find it interesting to look at the designs used in the products sold in local stores.	18(4.2)	59(13.8)	106(24.8)	187(43.8)	41(9.6)	16(3.7)
7. Industry cannot use creative people.	275(64.4)	56(13.1)	44(10.3)	24(5.6)	12(2.8)	16(3.7)
8. Some day I might start a business of my own	30(7.0)	55(12.9)	184(43.1)	91(21.3)	50(11.7)	17(4.0)
9. Industry provides products I need.	14(3.3)	18(4.2)	25(5.9)	154(36.1)	200(46.8)	16(3.7)
10. Industry does not need people with skills	278(65.1)	60(14.1)	26(6.1)	27(6.3)	18(4.2)	18(4.2)
	SD	D	U	A	SA	NR
11. Getting along with other people is important in industry.	10(2.3)	19(4.4)	42(9.8)	141(33.0)	198(46.4)	17(4.0)
12. Selling products is an important part of industry . .	11(2.6)	12(2.8)	19(4.4)	159(37.2)	208(48.7)	18(4.2)
13. I will probably work in industry.	32(7.5)	64(15.0)	161(37.7)	105(24.6)	48(11.2)	17(4.0)
14. Industry does an efficient job of producing products.	14(3.3)	23(5.4)	74(17.3)	237(55.5)	60(14.0)	19(4.4)
15. When I am in a store and have time, I look at construction of the products displayed.	25(5.9)	86(20.1)	90(21.1)	174(40.7)	36(8.4)	16(3.7)
	SD	D	U	A	SA	NR
16. People have to be able to follow orders in industry .	15(3.5)	17(4.0)	25(5.9)	169(39.6)	182(42.6)	18(4.2)
17. I like to compare products before buying one.	15(3.5)	24(5.6)	43(10.1)	191(44.7)	135(31.6)	19(4.4)
18. Industry needs people who have knowledge.	10(2.3)	14(3.3)	38(8.9)	152(35.6)	198(46.4)	15(3.5)
19. The more skilled a worker is the more pay he receives.	26(6.1)	38(8.9)	63(14.8)	162(37.9)	122(28.6)	16(3.7)
20. I like to look at the way materials are used in various products sold in the local stores	19(4.4)	55(12.9)	129(30.2)	168(39.3)	35(8.2)	21(4.9)

#The first figure indicates the number of individuals that selected the response. The number in the parenthesis is the percent of the total group that selected the response.

*SPEECHES; *INSTRUCTIONAL INNOVATION; OFFICE OCCUPATIONS EDUCATION; DISTRIBUTIVE EDUCATION; INDUSTRIAL ARTS; *STUDENT NEEDS; DISADVANTAGED YOUTH; EMPLOYER ATTITUDES; *VOCATIONAL EDUCATION; *EXPERIMENTAL PROGRAMS *AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968

Speeches presented at a series of general meetings concerned with secondary education programs are included. "Innovations in Business" by Mary Witherow describes the business education program at the O'Fallon Skill Center. "The Senior Intensified Program--Detroit Public Schools," by Vastene Woodhouse, outlines this combined distributive education and business education program which operates as a 3-year demonstration project using simulated facilities rather than the cooperative education format. "Innovative Programs in Industrial Arts" by Walter C. Brown reviews six diverse programs that were selected from a large group which will be reported in a later bulletin by the Industrial Arts Division. "Providing Individual Services for Vocational Students with Special Needs" by Christine W. Wallace outlines the resources and services needed to provide individual educational experiences for disadvantaged students. "A Businessman's View of Vocational Education" by Stanley Puddiford presents a personal reaction to several issues involving vocational education. (EM)

[1]Presented at the 62nd Annual Vocational Convention, Dallas, Texas, December 10, 1968.

Most businesses have as their ultimate purpose for existence a co-aim of (1) developing a product or providing a service, and (2) of doing so at a profit. I would like to submit today the possibility of making this a tri-aim, including on an equal basis (1) the training to develop a product or provide a service (2) the profit motive, and (3) the development of people.

This development of people is actually what we feel we are trying to do at the O'Fallon Skill Center. Our Skill Center is really an Area Vocational School and includes many areas of training besides business education, but the business education program has 4 sections -- accounting, clerical, data processing, and secretarial. These are not new to any of you, but because our literature has presented the scope and sequence of training in a little different light, I brought some of the folders for you to see if you are interested. The jobs for which the training will qualify the students are listed first and then the sequence of subjects required for each year in the program.

St. Louis, as is the case in all major cities, has a dropout problem -- the figures are staggering, and frightening. When a student passes the legal limit of 16, he's had it with books. Last year we lost a total of 3,500 students as dropouts. To this number add 1,500 as those suspended for various reasons, and you have a total of 5,000 restless teenagers.

This shows we've failed in our tri-aim of development at least of 5,000 students to any entry employment level. To help combat this, we created 2 new classes in the clerical training program. These are new this fall, so the opportunity for evaluation has been limited.

The freshman course entitled office orientation meets 7½ periods per week. This is really a simulated office situation with limited equipment -- trapezoidal tables in place of traditional arm chairs, a receptionist desk and chair, a fluid duplicator, four typewriters, three adding machines, and an overhead projector.

In this course every attempt is made to have the classroom assume an office atmosphere, and the problems and assignments are presented as prepared as if they are part of the work in an office. Students take turns serving as receptionist for the class, and the trapezoidal tables are placed in various arrangements to facilitate group work, demonstrations, and individual study as the instructional needs indicate.

Desirable office traits are stressed daily in the classroom, and the student is given actual practice in completing essential business forms. The general terminology applicable to most offices, and practical applications of mathematics and communications are stressed.

Actually this freshman foundation course is an attempt to make the training realistic for the student, keep the student motivated and hold him in school.

Following this introductory freshman class for the sophomore year the course is entitled junior clerk and consists of 4 ten-week areas of instruction for entry type employment. The four areas are -- cashiering, filing, payroll and stock and inventory.

In these four 10-week periods the students strive to acquire the knowledge, skills, attitudes, and characteristics needed for initial employment in any one of the four areas covered. The rooms are elaborately equipped with the latest in equipment -- automated checkout

lanes, cash registers, dummy stock merchandise (food and containers) calculators, typewriters, 10-key adding machines, typewriter billers, all types of files - visible, suspension, lateral, compartment, etc.

No one textbook provides the necessary instruction or drill material for this course. Last summer I supervised a committee of 5 teachers who wrote the curriculum guide, equipment companies provided training manuals and drill materials, and teachers have been preparing and sharing suitable materials.

Besides the regular office and distributive co-op programs which we have had for years in St. Louis, where the students attend school half a day and are employed half a day, this year emphasis has been placed on innovative work-study programs -- let me tell you about a few. These are inter-departmental in scope -- Bell Telephone, Stix, Baer and Fuller, a Standard Filling Station, house rennovation project, and a 3 building complex.

Yes, I would repeat our innovations in training center around development of people -- we stress behavioral and attitudes improvement and hope that in so doing we are contributing to the tri-aim of education.

FOR THE RECORDER

THE SENIOR INTENSIFIED PROGRAM -- Detroit Public Schools

by Mrs. Vastene Woodhouse

Perhaps one of the most important challenges facing us as business educators is program development. I have had the pleasure of being an integral part of the Senior Intensified Program since its inception in the Detroit Public Schools in 1966, and I have seen that this approach is a worth-while idea to the concept of business education. We in the Detroit metropolitan area have experienced a first-hand glimpse of a curriculum pattern which prepared senior high school students for employment.

There are some questions that I think that you would want answered in reference to the Senior Intensified Program:

What is Sip?

Why was it organized?

What does it offer to the students?

How does it operate?

SIP is a curriculum pattern designed to prepare high school students for employment in the following clusters of entry occupations:

Distributive Education--salespersons

Office Education--clerk stenographers/ clerk typists

Data Processing--console operators

Northern was the only high school in Detroit with the four programs in operation--so in a sense we were considered a pilot school.

The purpose of SIP WAS TO demonstrate that those minimal essential business skills demanded by employers for entry into todays' office and distributive occupations can successfully be taught in a speciall developed Senior

Intensified Program.

This development was made possible through the findings of a study made by Wayne State University entitled "Opportunities and Requirements for Initial Employment of School Leavers with Emphasis on Office and Retail Jobs" or sometimes referred to as Oreos. This was a cooperative study by business education representatives of the Detroit Public Schools, the University of Michigan and Wayne State University.

Employers of high school leavers (drop-outs or high school graduates) demand relatively few skills for the jobs available to youth with no previous work experience. Where specific skills are demanded--as in the distributive and office occupations--no data have been available on the minimal requirements for securing employment prior to the Oreos study. Consequently, the schools have taught skill courses that are often out of touch with the specific needs of the business community. In most cases, this combination of skill courses had taken an inordinate amount of the high school student's time. The SIP program, saves two-thirds of the time presently devoted to the now discrete, unarticulated and sometimes unrealistic course requirements.

As a three-year curriculum demonstration project, the Senior Intensified Program required that the entire content material be taught in a minimum of 80 minutes and/or a maximum of 120 minutes per day for not more than one school year. However, during the second year, 1967, it was found that in teaching the MUST and not the MIGHT of the curriculum patterns, we could shorten the three periods to two for the clerk-typists and distributive education clusters. A period in Detroit is usually 40 minutes.

The major differences in SIP and the already developed COOP curriculum patterns are as follows:

a. Students will not be required to have previous preparatory courses in the office occupations.

b. The minimal essential subject matter will be taught in its entirety in the senior school year.

c. Time will be used in varying patterns to allow the maximum fusion of several subject areas.

d. Methods, materials, and time allocations will be evaluated and revised to reflect innovations in business and education brought about by technological changes in educational facilities.

e. The focus will not be concerned with covering a book since there are no books used, but rather with teaching the essentials nneeded for entry occupations.

f. Each student will be placed in an on the job training station (cooperative work-study program) for one semester only.

I have found the SIP program rewarding, exciting, and frustrating. It has been rewarding in that I have seen the growth of youngsters with no previous business background, and their ability to perform satisfactorily in an on-the-job training stations. It has been exciting because the lessons were developed so that the content materials taught have been fused together so that there is continuity in a given subject area. It has been frustrating at times when a lesson plan called for a particular film or a transparency and it was unavailable or missing. But these were minor irritations in an innovative venture which helped me to change my outlook and my role as a business education teacher.

The proof of any pudding is in the eating--and I would say that our youngsters were that proof. I had 24 students in last year's class, 21 of whom worked as clerk/typists. I was very proud of them, and they were proud of themselves as they acted as good will ambassadors for Northern High School.

INDUSTRIAL ARTS DIVISION

American Vocational Association

INNOVATIVE PROGRAMS IN INDUSTRIAL ARTS

Walter C. Brown
Chairman
Innovative Program Committee

December 10, 1968

A committee was appointed in December, 1967 by the Industrial Arts Division of AVA to survey and report innovative programs in industrial arts. The committee has completed the survey and is in the process of reviewing and selecting those programs to be included in the report from those of the 118 submitted. The report today is only a sampling of some of the innovative programs which will be reported later in bulletin form.

1. Mass Production -- Serramonte High School, Daly City, California.

   The classes consist of two basic areas; Engineering Design in the Mechanical Drawing area and the Production Job Shop in the Wood-Metal-Plastics areas. Included in the course are departments of accounting, programming, design, engineering, drafting, sales, and production.

   Although manufacturing enterprises and mass production units are not new in industrial arts, the innovative feature in this program is that their work includes production of goods and services including an efficiency study of the school cafeteria.

2. Motivating Disadvantaged Pupils -- Wichita, Kansas.

   Students were given considerable freedom in the selection of projects. Parents were invited to join their sons in working on the projects. Metal and woods classes were operated evenings and Saturdays at four points in the disadvantaged areas of the city. Tuition and cost of materials were paid from Title I funds.

3. Team Teaching - Mass Production -- Parma, Ohio.

Two regular classes of seventh and eighth grade students were combined on a full-time basis for the entire semester. A regular class of ninth grade students participated intermittently as engineering consultants, and also assisted the three industrial arts instructors with instruction for seventh and eighth grade boys. Three c orporations were formed and products manufactured.

4. Research -- Cleveland Heights, Ohio.

In this program, a study is made of innovations which comprise our present technology and how these innovations may affect industry. Consideration is given to a favorable climate in which student can learn. Content centers around basic elements which provide a student with a better understanding of the latest technological developments and how these developments aid man in his mastery of materials and processes.

After the unit has been selected, students choose a topic within the unit for research study and reporting.

5. Individualized Programming -- Ft. Lauderdale, Florida.

There are two main features in the program which help in allowing for the individual differences. First, is the modular scheduling. This provides flexibility in the total school schedule and allows flexibility for meeting the time needs of a single student. Second, is the Learning Activity

Package or LAP as it is called at Nova.

This LAP is a form of programmed instruction, but with some special characteristics. The teacher is built in as an integral part of the LAP. It uses clearly stated behavior objectives arranged in order by learning level so the student understands what is expected of him. A variety of media and modes are used to help the student master the objectives. And, of great importance, the student is given the opportunity of making choices. These choices cover such things as taking a self-test or starting directly on assignments, which assignments he needs to do in order to meet the objectives, which of the media and modes are best suited for him, and to what depth he will work in a LAP beyond the required objectives.

6. Materials Fabrication -- Ft. Lauderdale, Florida.

The Materials Febrication Laboratory is equipped with the facilities necessary for a comprehensive study of technology in the areas of metals, plastics, and woods.

The heart of the program is the testing laboratory which enables the student to achieve a thorough understanding of the materials. A second area of study is processes and a third is fabrication.

AVA CONVENTION -- DALLAS

Secondary Education Program

Panel: The Disadvantaged

Topic: Providing Individual Services for Vocational Students with Special Needs

Look at the secondary student with special needs. Look at them; masses of them; numberless teenagers existing in every state -- concentrated in the cities -- scattered in the mountains and rural areas, migrating along the nation's highways. This is an important segment of the youth population.

Today, this panel calls them the disadvantaged. Let us change the pronoun from them to him. The term "disadvantaged" merely labels him. To serve him, the individual, requires that we deal with all of his uniquenesses. Individuality is the key to unlock his potential.

To help you see the individual, I've selected three from the mass of disadvantaged youth -- Geraldine, Crumby, and Lottie. Each is an individual with a preponderance of unmet needs. Providing individual educational experiences for them calls for:

1. Extensive assessment and diagnosis. Programs have failed, now we move to the individual and his learning problem. How does this person go about learning?
2. A tailored program to remove his educational blocks.
3. Instructional personnel -- a teacher -- a team.
   - A differentiated staff, including teacher aides
   - Over-trained teachers

. Empathy, understanding, and interest in working with persons with special needs

. Knowledge and versatility in subject matter

. Flexibility in methods of teaching and remedial techniques

. Pre-service training. Move the setting from the campus to the area of the disadvantaged. Rich background in psychology, sociology, and anthropology.

. All vocational education areas need sections in methods courses on the use of skills as a vehicle to teach the disadvantaged learner.

. In-service training

4. Administrators dedicated to the proposition that the problems of teaching the disadvantaged will not be solved with more of the same.

. Willing to innovate

- Flexible scheduling
- Differentiated staffing
- More intensive guidance services
- Facilities, etc.
- All-faculty member involvement

5. All agencies working together to serve him. Education; Child Welfare; Mental Health; Public Assistance; Public Health; ESEA I, III, and VIII; Etc.

6. His community, including his parents, working together. The real evaluation, in terms of the individual, the product. We must be willing to be held accountable!

62nd ANNUAL VOCATIONAL CONVENTION
DALLAS, TEXAS
December 11, 1968

Panel on Safety and Work Hazard Implications of Vocational Education

CHAIRMAN: James O. Reynolds
Dayton Public Schools
Dayton, Ohio 45202

Speaker: Bruce F. Hillenbrand, Chief
Division of Youth Safety
Office of Occupational Safety
Bureau of Labor Standards
U. S. Department of Labor
Washington, D. C. 20210

I would like to direct my remarks toward the role of the Youth Safety Division as it relates to the recent amendments to the Vocational Education Act. First, Section G relating to cooperative vocational education programs and more specifically to Section H on the work-study programs.

The programs of youth, especially disadvantaged youth, have received intensive studies by many agencies and organizations. We have learned some things and indeed have much more to learn. We know that youth, for whom bridges from school to work are smoothest, are those with the intensive preparation provided by professional training at the secondary and college level and beyond. For them, careers are virtually assured and unemployment is very low. Vocational

preparation at the secondary level offers a great challenge to educators. As you know, for many of these youth, graduation from high school represents a termination of their educational career. The recent amendments to the Act obviously are directed toward improving job preparation for many more youth, thereby making the transition from school to work easier. We, in the Youth Safety Division, feel that we can and do have a unique role to play in the job preparation process. In this connection, let me first give you a run down on what we do and why we do it.

Under the Fair Labor Standards Act, which sets 16 as a basic minimum age for employment, the Congress gave additional authority to the Secretary of Labor to find and determine which jobs are too hazardous for youth 16 and 17 years of age in nonagricultural occupations. Additionally, the Secretary was given authority to determine occupations and the conditions under which 14- and 15-year-olds might be employed.

In 1966, the Congress included in its amendments to the Fair Labor Standards Act authority for the Secretary to determine those occupations in agriculture which are too hazardous for youth under 16. The Youth Safety Division of the Bureau of Labor Standards has been delegated responsibility for carrying out the Secretary's mandate under this Federal law. The procedures involved in developing regulations and orders are very detailed and include: Intensive research and study; on-site observations; consultation with safety officials, educators, labor officials, and experts in various fields; and public hearings.

Much has been made of the barriers which child-labor laws place in the way of youth employment, particularly during summer months and school vacation periods when large numbers of young people are seeking jobs. Arguments have been advanced that many of the child-labor laws are outdated, and a modification of them would substantially increase employment opportunities for youth. In addition, arguments have been advanced that suitable work experience in connection with

schooling might be appropriate. Present laws, including the Federal law which does not permit youth under 16 to work during school hours, make it almost impossible for 14- and 15-year-olds to participate in a combined school and work-experience type program. For these and many other reasons the Federal orders and regulations are under constant review, and numerous amendments have been made over the years to improve and keep them in line with technological and other changes.

With any change in Legislation involving young workers, we always try to see what modifications, if any, are needed to adapt our regulations. For example, with the 1966 amendments to the Economic Opportunity Act, Neighborhood Youth Corps enrollees can participate in work-experience programs conducted by private industry as well as by public and private nonprofit agencies. This change spurred us to review Federal orders and regulations affecting young workers. We wanted to assure that the child-labor provisions of the Federal Fair Labor Standards Act would protect youth against undue hazards to his

schooling, health, and well-being; but that they do not, through obsolescence, unnecessarily restrict their employment opportunities.

Some 17 Hazardous-Occupations Orders have been adopted since 1938 when the Act was passed for persons under 18. Some of these orders have been revised; but as you know industry is dynamic -- our technology is ever-changing. Some of the questions we were faced with were: Have any of the technological changes rendered the orders and regulations obsolete? Could youth under 18 now work safely at previously prohibited occupations?

Obviously, we didn't want to open up job opportunities which would kill or injure our youth. Obviously, we didn't <u>then</u> and don't <u>now</u> want to allow kids under 18 to manufacture explosives, although the industry has an excellent safety record. Or mine coal or copper or other extractive raw materials in an industry which has the highest injury rate of all. We don't want our youth exposed to radioactive substances and so on.

Let me just give you a brief run down on the changes that we have made during the last year. Order No. 7, which covers operating elevators, was changed to allow 16- and 17-year-olds to operate automatic elevators. Secondly, 14- and 15-year-olds are now permitted to work until 9 p.m. instead of 7 p.m. during the summer from June 1 through Labor Day. As you can see, this coincides with the months that have Daylight Saving Time and the usual summer school vacation period.

These two modifications were included in what I might call the first "batch" of revisions following initiation of a review of all of the regulations. They became effective November 1, 1967.

Adopted in this first group were three other changes. One allows 16- and 17-year-olds to work as helpers on motor vehicles on public or private roads as long as they ride inside the vehicle cab; and under certain conditions to drive motor vehicles on private property, such as light pick-up trucks around motel grounds.

The second change was our first effort to coordinate labor standards with manpower training of Neighborhood Youth Corps enrollees. Fourteen and 15-year-olds can now participate in Neighborhood Youth Corps work-training programs during school hours if there is adequate assurance that the employment will not interfere with the youth's schooling, health, and well-being.

The final change announced in this group was a brand new venture for the Labor Department -- that is regulating youth employment in agriculture. We had long been familiar with industrial hazards, but farm hazards were a new problem. On January 1, 1968, an interim agricultural order was issued in response to the 1966 amendments to the Fair Labor Standards Act in which the Congress directed the Secretary to identify farm occupations particularly hazardous to youth under 16 years of age.

The interim order deals with handling chemicals presenting serious health hazards; blasting agents; serving as flagman for

aircraft spraying crops; driving cars, trucks, or buses on public roads; operating large tractors and their equipment; working from ladders or scaffolds above 20 feet and so on.

I would like to underscore the fact that the interim order exempts students enrolled in cooperative vocational agricultural programs. In fact, on June 6 of this year, the Secretary modified the order to permit 14- and 15-year-olds to drive tractors and operate other farm machinery provided they complete formal training in the safe use of such equipment. This exemption or program is administered by the U. S. Department of Agriculture's Federal Extension Service and its cooperative units. Employers of such youth must instruct them in the safe and proper operation of the specific equipment they will use, check on their performance at least three times a day, and keep on file certificates showing the youth has been trained.

In case you might wonder why we have an "interim" order -- we wanted to get experience with agricultural occupations. In fact, we

have recently initiated a review of this order to determine if it is fulfilling its intended purpose, namely, to protect young persons under 16 years of age from undue hazards in agricultural employment.

On September 5, following a complete review of all our orders and regulations, the Secretary approved certain further modifications. First, the order dealing with motor-vehicle driving was amended to allow 16- and 17-year-olds to drive cars and light trucks during daylight hours as occasional and incidental parts of their duties, provided they hold a State driver's license and have completed a State-approved driver education course. The vehicles, however, must be equipped with seat belts for the driver and helper.

Another modification stemmed from the 1966 Congressional extension of the Fair Labor Standards Act coverage to certain State employees. Some 16 States had permitted youth under 18 to drive school buses and desired to continue. Following surveys of equipment and driver selection, training, and supervision practices in these States

as well as their accident experience, 16- and 17-year-olds will now be permitted to drive school buses upon approval granted by the Secretary of Labor. This approval will be based upon applications filed by the Governor of any State desiring to employ minors of this age group as school bus drivers. Approval of the applications will be based upon whether certain safety standards are met.

And to complete the record, another modification, of particular interest to you perhaps, exempts vocational educational student-learners graduating from high school before their 18th birthday from the hazardous orders for occupations in which they have completed training as student-learners. In this connection, I would like to point out that seven of the 17 existing orders for 16- and 17-year-olds now contain exemptions for apprentices and student-learners enrolled in bona fide cooperative vocational education programs. I might also add that consideration is being given to extending these exemptions to other orders. This is an example of how we have recognized the need for

making adjustments in our regulations for young employees who perform their work under safely guarded and properly supervised conditions. Even more important, now we will need to take a hard look at these exemptions to see if they can be made applicable to the work-study programs authorized under the new amendments to the Educational Act. In this area, you can be of valuable assistance to us. Suggestions on changes to Federal child-labor regulations -- or questions on their application -- will be most welcome, and will receive prompt attention. Your cooperation will help assure that the Federal regulations provide maximum protection without unnecessarily restricting educational and employment opportunities for our youth.

62nd ANNUAL CONVENTION
AMERICAN VOCATIONAL ASSOCIATION
DALLAS, TEXAS
DECEMBER 10, 1968
STANLEY PUDDIFORD

Ladies and Gentlemen, thank you for the privilege of being with you.

A short time ago, I read a report written by James A. Stone, a college president, and directed to fellow educators. In it he asked these questions --

"--1. Who shall be educated?

--2. What shall be taught?

--3. How shall the work be done?

--4. By whom shall it be done?"

Then he went on and I quote --

"-- We ought to have a mutual understanding in reference to these subjects; and the public have a right to know our opinions, and to compare them with our practice.

"-- We shall seek to find out whatever may be made useful, and to teach it; what things belong to a progressive civilization and to incorporate them into our system.

"-- In educating the young, all systems aim at discipline, instruction, and communication of knowledge. But in modes and plans, general and special, we must vary according to the age in which we live, and the circumstances under which we find ourselves. Government, religion, race, national spirit -- the very mountains, lakes, rivers and prairies of a land must and will make a difference.

"-- We must understand our American youth, their cast of mind, and the sphere in which they are destined to move, as also the spirit of her institutions and her laws." End of quote.

I believe many in this room have been challenged by questions and opinions similar to those which James Stone shared with his colleagues January 1, 1857 -- one hundred and eleven years ago.

Yes, answers are being sought today as then. But the scene has changed. Reflect for a moment on the changes which have come about during our life time -- many of which we take for granted. In communication -- and incidentally tools of education -- we have gained the use of radio, talking pictures, television, recording devices, and most recently color has been added to television and the small camera. Even the term electronics did not exist when I was in college. All of this causes one to wonder about the meanings that those same words might have conveyed had they been written and considered 25, 50, or 75 years ago. Surely, the intent would be similar. And at each stage, people would attempt to adjust the meaning to their time.

May we assume that all would seek to determine a Degree of Relevance? Much as you seek to determine the Degree of Relevance of the work you and your colleagues do in the classroom, shop or laboratory.

When speaking of Relevance, the educator involved in vocational education is on the front line. He is close to the World of Work. This is particularly true for the men and women engaged in co-operative education as they go about selecting related training material, plan its use in the classroom then evaluate, with the employer, the Relevance of the students experiences and job preparation.

Let me say that the supervisors in my Company look forward to these evaluation meetings with Mrs. Woodhouse and her fellow teachers. They all consider this to be most important and a real opportunity to insure they will get better employees in the future.

Frankly, I suggest that you have a tremendous responsibility.

For example, I understand that 60 percent of the current graduates of Detroit high schools are available for employment directly upon graduation -- at least they do not request transcripts of their credits for college. While, 60 percent is the average, the range is from 90 percent to 10 percent. Most will agree that the number of students -- graduates and drop-outs -- who enter the labor force directly from the high school classroom is increasing.

Let us examine James Stone's second point, "What shall they be taught?"

Vocational education people are in the position to develop and demonstrate outstanding competence in providing the many answers to this question. Continuing detailed examination of the specific occupations will be required. Prerequisites outlined by employment people will have to be up-dated -- even challenged in many instances, if real Relevance is to be determined. The development of effective channels of communication with the workers and supervisors of any given occupation suggests a relationship far beyond a once a year, half hour conference. Business and industrial management people, and school administrators will have to be sold on the necessity for very close cooperation. Both will have to be more aware of the ultimate and short range values to be obtained. The need for nearly complete objectivity will become evident if effective adjustments are to be made promptly. The business and industrial people will be called upon to cast aside their image of the classroom which they left, and become familiar with the activities of today and tomorrow. Perhaps, some school system will use its facilities and personnel to develop an adult education course which will up-date management people, improve appreciation for the work of today's educator, and provide a forum for exchange and study of examples of the motivational,

the academic and the skill development of their future employees.

I am reminded of a survey made by the Department of Labor a few years ago which revealed that the average male worker had been in his present job 5.5 years and can be expected to hold more than eight jobs during his working life. In addition, the dimensions and content of each of the eight jobs will undergo significant change during the worker's tenure in them. As a result of both the evolutionary changes and the conscious shifts in direction by the worker, these eight jobs may fall into as many as three distinct career categories.

Does this movement of workers suggest that the specialist may be passed by? Specialization, in the conventional sense, may limit the background of a person enough to impede adjustment to rapid changes.

In commenting on this thought, Daniel Parker, said, "...a reorientation of the curricula on both high school and college levels is needed to provide students with a basic type of education and training -- a knowledge of fundamentals broadly applicable to a large number of occupational areas, each of which is in a continuing state of transition. In a sense, therefore, the traditional concept of training for a vocation will have to be supplanted by a kind of occupational orientation adaptable to the changes wrought by technology."

Yes, I agree, this appears to present a pragmatic dilemma. But, let us temper our judgement with the thought that James Stone gave us, namely, "...we must vary according to the age in which we live, and the circumstances under which we find ourselves."

Some would say that we must face relentless, revolutionary Change in our society, in contrast to the more evolutionary transition of earlier times.

It seems to me that the vocational educator's prime role can be that of the skilled observer, communicator, and the driving force in future action programs of the educational community.

I have been impressed by the shift made by business. No longer is there just talk. Today there is a nation-wide action program directed toward employing the disadvantaged. Under the National Alliance of Businessmen there are aggressive, outreaching programs, which recruit the under-achiever. Pre-employment procedures have been changed. Supervisors are being trained to better understand and assist. New training techniques are being used, while others are being developed.

So we come to the one strangely lasting question of Stone's, "Who shall be taught?"

With business and industry's recent commitment to finding a place for the underprepared in its employment ranks, that question becomes one of the most urgent faced by inventive educators, today.

They're a new kind of candidate for learning. He's not a volunteer, exactly. He's more likely to be a despairing, angry, perhaps even militant drop-out who's giving it one more try. He's wondering if there's something that he can learn to do that will get him either more money or respect from his peers than stealing, or pimping, or pushing dope.

And he won't necessarily be a student you've chosen. He may have been sent, a recruit, some zealous government agent or business missionary sent your way.

He's going to present special problems of discipline, motivation and placement.

But I think that's just the special kind of mission vocational education has been proposing for a long time. For years, I'm afraid, the

sad but true fact of the matter has been that vocational education had the back room assignment of keeping the non-college bound student on the payroll and off the public dole. And its been a three-sided struggle, with the student who's underestimated, the commercial interests who've wondered why you aren't offering them the cream of the intellectual crop, and the educational administration concerned with getting these non-movers and shakers through as cheaply as possible.

Now society's business and industrial complex is beginning to make noises which, if followed through, will make vocational education the focal point of attention. It's going to be brought right out into the front room of life. Their mission can't be simply that of rescuing individuals, if I may use an item that I intend as a compliment in every sense, but the mission will be that of recovering a most human resource that we've only now begun to recognize as nearly wasted.

I believe that vocational education is going to use that challenge. And that for several years to come vocational education is going to be at the cutting edge rather than the trailing edge of the educational enterprise. We'll meet the challenge because we have been preparing for these times -- perhaps without realizing it -- for many years. We can't fail at this. And we won't.

This past fall an alumnus of a Big Ten university's school of engineering returned to his campus, as old grads are want to do during the football season.

Having a few moments to kill, the old grad thought he'd drop by the Dean's office and talk over old times.

As it turned out, the good Dean had a meeting in progress, so he had to cool his heels in the outer office for a time. While he waited, he happened to pick up a sheet of paper that had slipped from the secretary's desk and he glanced through its contents.

The alumnus was bemused to discover that the sheet contained a list of exam questions. Then, shocked at what he read, he almost shouted at the secretary:

> "Why these questions are the same ones that were being asked when I was a student here 20 years ago."
>
> "Yes," replied the secretary, "that's right; those are the same questions. But, you see, now all the answers have changed."

It seems to me that that's the situation with all human education. Most of the questions about sustaining life, caring for our bodies, feeding and clothing ourselves, finding outlets for our emotions, acquiring knowledge, are not new. They've been asked for thousands of years. But now the answers are different. And the challenge is to keep supplying the information and techniques that are relevant to the questions that we are being asked. Not only relevant to the questions, but also relevant to the new information and new techniques that respond to those old questions with always the newest answers.

Please let me say in conclusion that I am grateful indeed for the opportunity that this occasion, and your patience, have given me to review some of my concerns. Thank you.

Pub Date - Dec68 29p.

*POST SECONDARY EDUCATION; *VOCATIONAL EDUCATION; *PROGRAM DESCRIPTIONS; *EDUCATIONAL NEEDS; COST EFFECTIVENESS; TECHNICAL EDUCATION; PROGRAM DEVELOPMENT; EXPERIMENTAL PROGRAMS; DEVELOPMENTAL PROGRAMS; *SPEECHES
*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968; WISCONSIN

Speeches reported are: (1) "Programs in Post Secondary Preparatory Vocational Education," by C.L. Greiber, containing a description of the development of post secondary vocational education in Wisconsin, (2) "Need for Developmental and Experimental Vocational Programs at the Post Secondary Level," by R. Yarborough, containing the view of Congress toward vocational education and a discussion of trends, including the shift of emphasis from the secondary to the post secondary level, the thousands of disadvantaged young people who drop out of high school, and the improbability of a single-purpose terminal secondary school program adequately preparing students for a lifetime career, and (3) "The Economics of Vocational Education at the Post Secondary Level," by A.B. Wooten, stating that vocational education can accelerate major improvements in our production process by making people more receptive to new techniques and innovations, promoting the specialization and intensification of labor use, promoting labor mobility geographically and between industries, and insuring that those individuals who are responsible for making major technical and economic decisions possess the necessary knowledge. PROGRAMS IN POST-SECONDARY PREPARATORY VOCATIONAL EDUCATION

by
C. L. Greiber, Director
Wisconsin Board of Vocational, Technical and Adult Education

MORE THAN 28,000 DIFFERENT INDIVIDUALS ARE PRESENTLY ENROLLED IN FULL-TIME ONE AND TWO YEAR POST SECONDARY PROGRAMS IN WISCONSIN'S AREA VOCATIONAL AND TECHNICAL SCHOOLS, TECHNICAL INSTITUTES AND TECHNICAL COLLEGES.

OUR STATE HAS DEVELOPED A PHILOSOPHY OF OFFERING A BALANCED PROGRAM OF VOCATIONAL AND TECHNICAL EDUCATION TO ALL THE PEOPLE. EVERY ATTEMPT IS BEING MADE TO FULFILL THE PURPOSES OF THE FEDERAL GRANTS WHICH INCLUDE THE DEVELOPMENT OF PROGRAMS SO THAT PERSONS OF ALL AGES, IN ALL COMMUNITIES OF THE STATE; THOSE IN HIGH SCHOOL, THOSE WHO HAVE COMPLETED OR DISCONTINUED THEIR FORMAL EDUCATION AND ARE PREPARING TO ENTER THE LABOR MARKET BUT NEED TO UPGRADE THEIR SKILLS OR LEARN NEW ONES, WILL HAVE READY ACCESS TO VOCATIONAL TRAINING OR RETRAINING WHICH IS OF HIGH QUALITY AND REALISTIC IN LIGHT OF ANTICIPATED OPPORTUNITIES FOR GAINFUL EMPLOYMENT.

STATE LEGISLATION IN WISCONSIN INCLUDES THIS SAME CHARGE TO THE VOCATIONAL AND TECHNICAL EDUCATION SYSTEM; TO MEET THE NEEDS OF ALL THE PEOPLE WITH TRAINING WHICH IS REALISTIC TO THEIR NEEDS. AS A RESULT, ALL PEOPLE IN WISCONSIN HAVE AVAILABLE TO THEM TRAINING OPPORTUNITIES WHICH WILL ENABLE THEM TO PREPARE FOR THE WORLD OF WORK AND TO ADEQUATELY MEET THEIR SOCIAL AND CIVIC RESPONSIBILITIES.

EMPHASIS IS GIVEN TO DEVELOPMENT OF ADEQUATE VOCATIONAL AND TECHNICAL EDUCATION OPPORTUNITIES FOR HIGH SCHOOL AGE YOUTH INCLUDING HIGH SCHOOL DROP OUTS; YOUTH WHO HAVE GRADUATED AND NEED ADDED TRAINING TO PREPARE FOR A SKILLED OR TECHNICAL OCCUPATION AND OUT-OF-SCHOOL ADULTS. IN THIS WAY WE IN WISCONSIN

FEEL THAT VOCATIONAL AND TECHNICAL EDUCATION IS FULFILLING THE CHARGE IT HAS BEEN GIVEN, TO PROVIDE EDUCATIONAL OPPORTUNITIES TO ALL THE PEOPLE OF THE STATE WHICH IS REALISTIC IN LIGHT OF THEIR NEEDS AND THE MANPOWER REQUIREMENTS OF BUSINESS AND INDUSTRY.

OUR STATE IS MOST FORTUNATE IN THAT THE VALUES OF VOCATIONAL AND TECHNICAL EDUCATION ARE RECOGNIZED BY MANY OF OUR RESPONSIBLE ADMINISTRATORS OF HIGHER EDUCATION. DR. CURTIS W. TARR, PRESIDENT OF LAWRENCE UNIVERSITY AND CHAIRMAN OF THE GOVERNOR'S TASK FORCE ON TAX REVISION, RECENTLY MADE THE FOLLOWING STATEMENT IN THE OFFICIAL UNIVERSITY PUBLICATION:

"TOO MANY OF OUR YOUNG PEOPLE ARE BEING LED INTO LIVES OF FRUSTRATION BY WAY OF UNDERGRADUATE WORK IN A LIBERAL ARTS INSTITUTION. A MUCH HIGHER SHARE OF PRESENT AMERICAN COLLEGE STUDENTS, AS WELL AS THEIR COUNTERPARTS AWAY FROM SCHOOL, SHOULD BE ENROLLED IN PROGRAMS PREPARING THEM FOR THE JOBS WHICH OUR TECHNOLOGICAL SOCIETY OFFERS BUT CANNOT FILL. A MORE EFFECTIVE PROGRAM OF VOCATIONAL EDUCATION COULD ASSIST OUR NATION TO OVERCOME ITS MOST COSTLY LOSS; THE CREATIVE TALENT OF THAT SUBSTANTIAL FRACTION OF OUR PEOPLE WHO ARE NOW UNEMPLOYABLE.

"VOCATIONAL INSTITUTES SHOULD PROVIDE THESE ADVANTAGES JUST AS OTHER COLLEGES DO: THEY COULD SPONSOR NEWSPAPERS, RADIO STATIONS, ATHLETIC TEAMS, STUDENT GOVERNMENT, AND A SPIRITED SOCIAL LIFE. LIVING FACILITIES SHOULD SURROUND THE CAMPUS SO THAT A YOUNG PERSON CAN LIVE AWAY FROM HOME IF HE WISHES. DEGREES CAN BE GRANTED FOR THE WORK DONE. EVERY EFFORT SHOULD BE MADE TO EMPHASIZE THE VOCATIONAL COLLEGE AS A WORTHWHILE ALTERNATIVE TO THE LIBERAL ARTS COLLEGE."

SENATOR WAYNE MORSE IN THE JUNE ISSUE OF COMPACT MADE SEVERAL SIGNIFICANT STATEMENTS REGARDING VOCATIONAL EDUCATION AND ITS FUTURE DEVELOPMENT. HE STATED THAT THERE ARE THREE FACETS OF THAT ACT (THE VOCATIONAL EDUCATION ACT OF 1963) WHICH ARE OF PRIME IMPORTANCE:

1. A RECOGNITION OF POST SECONDARY AND ADULT EDUCATION AS THE AREAS OF FUTURE GROWTH.
2. SPECIAL PROGRAMS TO MEET SPECIAL NEEDS OF PERSONS WHO BY REASON OF DISADVANTAGE OR HANDICAP HAVE DIFFICULTY IN SUCCEEDING IN REGULAR PROGRAMS.
3. PROVISION FOR A COMPLETE PROFESSIONAL EVALUATION AFTER FIVE YEARS OF OPERATION.

SENATOR MORSE THEN POINTED TO THE FACT THAT AN EVALUATION WAS COMPLETED IN JANUARY, 1968 AND THAT THE IMPORTANCE OF POST SECONDARY VOCATIONAL EDUCATION MUST NOW BE RECOGNIZED AND DEALT WITH IN CONSIDERING VOCATIONAL EDUCATION. HE STATED FURTHER "POST SECONDARY EDUCATION HAS REPLACED SECONDARY EDUCATION AS THE TERMINAL PROGRAM FOR A MAJORITY OF AMERICAN YOUNG PEOPLE. HIGH SCHOOL VOCATIONAL EDUCATION PROGRAMS SHOULD REFLECT THIS CHANGE."

IN ORDER THAT VOCATIONAL AND TECHNICAL EDUCATION OPPORTUNITIES MIGHT BE EXPANDED AND FURTHER DEVELOPED ON THE POST SECONDARY LEVEL, THE WISCONSIN LEGISLATURE IN 1965 ADOPTED THE RECOMMENDATIONS OF GOVERNOR KNOWLES BY PASSING A MODERN AND COMPREHENSIVE LAW FOR THE AREA ADMINISTRATION OF VOCATIONAL AND TECHNICAL POST SECONDARY EDUCATION PROGRAMS. UNDER THE OLD LAW, VOCATIONAL AND ADULT EDUCATION DISTRICTS WERE CONTIGUOUS WITH CITY BOUNDARIES, OR IN A FEW INSTANCES SCHOOL DISTRICT BOUNDARIES, AND WERE LARGELY MUNICIPALLY SUPPORTED AND CONTROLLED. UNDER THE NEW LAW ALL AREAS OF WISCONSIN MUST, BY JULY 1, 1970, BE INCLUDED IN AREA

VOCATIONAL AND TECHNICAL EDUCATION DISTRICTS CONFORMING TO A STATE PLAN, WITHIN BOUNDARIES APPROVED BY THE STATE BOARD.

CRITERIA FOR ESTABLISHING A DISTRICT HAVE BEEN DEVELOPED BY THE STATE BOARD AND THE COORDINATING COUNCIL FOR HIGHER EDUCATION. THEY PROVIDE FOR:

1. MINIMUM POPULATION OF 180,000 PERSONS
2. AT LEAST 3,200 STUDENTS ENROLLED IN THE 12th YEAR OF THE SECONDARY EDUCATION PROGRAMS WITHIN THE DISTRICT, TO PRODUCE A MINIMUM POST SECONDARY STUDENT BODY OF AT LEAST 750 TO 800 IN EACH TECHNICAL INSTITUTE OR TECHNICAL COLLEGE.
3. MINIMUM EQUALIZED DISTRICT VALUATION OF $450,000,000.

BY APPLYING THESE CRITERIA, A STATE PLAN WAS DEVELOPED WHICH PROVIDES FOR DIVIDING THE STATE, WHICH HAS A TOTAL POPULATION OF APPROXIMATELY 4,400,000 PERSONS AND A TOTAL AREA OF 56,000 SQUARE MILES, INTO EIGHTEEN AREA VOCATIONAL-TECHNICAL DISTRICTS.

PRIOR TO JULY 1, 1970 DISTRICTS MAY BE ESTABLISHED BY VOLUNTARY ACTION TAKEN BY ONE OR MORE COUNTY BOARDS OR ONE OR MORE SCHOOL DISTRICT BOARDS OPERATING HIGH SCHOOLS, SUBJECT TO MEETING MINIMUM CRITERIA AND APPROVAL BY THE STATE BOARD AND THE COORDINATING COUNCIL FOR HIGHER EDUCATION.

AT THE PRESENT TIME APPROXIMATELY 3,500,000 OF THE STATE'S POPULATION RESIDE IN POST-SECONDARY VOCATIONAL AND TECHNICAL EDUCATION DISTRICTS. ABOUT 900,000 PERSONS RESIDE IN DISTRICTS ORGANIZED UNDER THE OLD LEGISLATION, LARGELY IN MILWAUKEE COUNTY AND 2,600,000 RESIDE IN NEWLY CREATED AREA DISTRICTS. THESE DISTRICTS INCORPORATE APPROXIMATELY THREE-FOURTHS OF THE AREA OF THE STATE. DISTRICTS RANGE IN SIZE FROM SINGLE COUNTY UNITS IN THE MORE POPULOUS SOUTHEASTERN AREA OF THE STATE TO DISTRICTS WITH AS MANY AS EIGHT COUNTIES IN THE LESS POPULOUS NORTHWESTERN SECTION OF OUR STATE.

DISTRICTS ARE GOVERNED BY BOARDS COMPOSED OF REPRESENTATIVES OF LABOR, MANAGEMENT AND THE PUBLIC, WITH MEMBERS APPOINTED BY CHAIRMEN OF EITHER COUNTY OR SCHOOL DISTRICT BOARDS. THE APPOINTING AUTHORITIES ARE EITHER COUNTY OR SCHOOL DISTRICT BOARD CHAIRMEN.

EACH BOARD, AFTER APPOINTMENT, HAS FISCAL INDEPENDENCE AND THE AUTHORITY TO LEVY UP TO TWO MILLS ON THE EQUALIZED VALUATION FOR THE SUPPORT OF THE PROGRAM. IN ADDITION, STATE LAW PROVIDES FOR METHODS OF RAISING ADDITIONAL FUNDS FOR FACILITY CONSTRUCTION. IT IS INTENDED THAT EACH DISTRICT HAVE ONE COMPREHENSIVE AREA SCHOOL WHICH IS USUALLY A TECHNICAL INSTITUTE.

ENROLLMENTS IN MOST OF THE FULL-TIME POST SECONDARY INSTITUTIONS WILL VARY FROM A MINIMUM OF 700 TO A MAXIMUM OF 12,000 STUDENTS (IN MILWAUKEE). PROGRAM OFFERINGS INCLUDE ONE AND TWO YEAR VOCATIONAL PROGRAMS AND TWO YEAR ASSOCIATE DEGREE TECHNICAL PROGRAMS. THREE OF THE SCHOOLS ARE APPROVED BY THE NORTH CENTRAL ASSOCIATION OF COLLEGES AND UNIVERSITIES TO OFFER LIBERAL ARTS PARALLEL PROGRAMS.

THE VOCATIONAL AND TECHNICAL OFFERINGS RANGE FROM BARBERING AND SHOE REPAIRING TO DATA PROCESSING AND TELECASTING. THE SYSTEM PROVIDES A WIDE RANGE OF OFFERINGS IN THE HEALTH OCCUPATIONS, AGRI-BUSINESS, OFFICE OCCUPATIONS, MARKETING AND DISTRIBUTION, AND INDUSTRIAL OCCUPATIONS AND TECHNOLOGIES.

EXTENSIVE USE IS MADE OF ADVISORY COMMITTEES IN THE ESTABLISHMENT OF NEW PROGRAMS, THE DEVELOPMENT OF CURRICULUM, AND IN PROVIDING INFORMATION TO BUSINESS, INDUSTRY, PARENTS AND POTENTIAL STUDENTS. MORE THAN 4,000 PERSONS SERVE ON STATE AND LOCAL ADVISORY COMMITTEES AND ATTEND MEETINGS, WITHOUT HONORARIUM OR EXPENSE REIMBURSEMENT. TYPICAL COMMITTEES ON THE STATE LEVEL INCLUDE: HEALTH, MARKETING AND DISTRIBUTION, OFFICE EDUCATION AND DATA PROCESSING TO NAME ONLY A FEW.

NO NEW PROGRAMS ARE CONSIDERED FOR ESTABLISHMENT UNTIL A REQUEST IS RECEIVED FROM REPRESENTATIVES OF THE OCCUPATIONAL FIELD OR TECHNOLOGY INDICATING A NEED FOR THE TRAINING.

TYPICAL OF PROGRAM DEVELOPMENT IS THE METHOD WHICH WAS USED IN THE ESTABLISHMENT OF DENTAL ASSISTANT PROGRAMS IN THE STATE. A REQUEST FOR TRAINING WAS RECEIVED FROM THE EXECUTIVE COMMITTEE OF THE STATE DENTAL ASSOCIATION IN 1963. AFTER THE REQUEST WAS RECEIVED IT WAS CAREFULLY EVALUATED AND A COMMITTEE COMPOSED OF LOCAL DIRECTORS, REPRESENTATIVES OF THE STATE DENTAL SOCIETY, MARQUETTE UNIVERSITY AND THE STATE BOARD STAFF MET TO REVIEW THE NEED FOR TRAINING. AFTER THE NEED WAS CLEARLY ESTABLISHED, PILOT PROGRAMS WERE DEVELOPED IN THE MADISON AND MILWAUKEE SCHOOLS. AFTER SUCCESSFUL OPERATION FOR TWO YEARS, WHICH INCLUDED PLACEMENT OF GRADUATES, ADDITIONAL PROGRAMS WERE APPROVED IN THE STATE TO MEET THE NEED FOR THIS TYPE OF TRAINED PERSONNEL. SIMILAR METHODS HAVE BEEN USED IN THE DEVELOPMENT OF PROGRAMS IN DATA PROCESSING, DENTAL HYGIENIST, TRUCK DRIVER TRAINING, ELECTRONIC TECHNOLOGY, MECHANCIAL DESIGN, LIBRARY ASSISTANTS, HORTICULTURE AND MANY OTHERS.

A SYSTEMATIC PLAN OF PERIODIC EVALUATION HAS BEEN DEVELOPED WHICH UTILIZES THE SERVICES OF REPRESENTATIVES OF LABOR, MANAGEMENT AND OTHER EDUCATIONAL INSTITUTIONS IN DETERMINING THE QUALITY OF THE PROGRAM OFFERINGS. EVALUATIONS ARE CONDUCTED BY THE STATE STAFF, WITH THE ASSISTANCE OF INVITED CONSULTANTS, OF THE TOTAL SCHOOL PROGRAM INCLUDING ADMINISTRATION, FACILITIES, STAFF QUALIFICATIONS, CURRICULUM AND PLACEMENT. SPECIFIC PROGRAM EVALUATIONS ARE ALSO CONDUCTED BY COMMITTEES APPOINTED BY THE STATE DIRECTOR COMPOSED OF REPRESENTATIVES OF THE OCCUPATIONS OR TECHNOLOGIES IN WHICH THE TRAINING IS PROVIDED. REPRESENTATIVES OF INSTITUTIONS OF HIGHER EDUCATION WHO HAVE KNOWLEDGE IN THE PROGRAM FIELDS TO BE EVALUATED ARE ALSO INCLUDED ON THESE COMMITTEES. THIS PLAN IS USED TO DETERMINE

WHETHER PROGRAMS MEET QUALITY STANDARDS, ELIGIBILITY FOR THE ASSOCIATE DEGREE, ETC.

THE WISCONSIN LEGISLATURE IN 1963 ENACTED LEGISLATION AUTHORIZING THE STATE BOARD TO GRANT THE ASSOCIATE DEGREE FOR SUCCESSFUL COMPLETION OF TWO YEAR TECHNICAL PROGRAMS WHICH HAVE BEEN EVALUATED AND APPROVED IN ACCORDANCE WITH THE PROCEDURES ESTABLISHED BY THE BOARD. STATE BOARD AUTHORIZATION IS GRANTED TO LOCAL AND AREA BOARDS TO GRANT DIPLOMAS AND CERTIFICATES TO GRADUATES OF ONE AND TWO YEAR VOCATIONAL PROGRAMS BASED UPON THE STATE PLAN OF COMMITTEE EVALUATION AND APPROVAL.

THE GROWTH AND DEVELOPMENT OF WISCONSIN'S PROGRAMS IN FULL-TIME POST SECONDARY VOCATIONAL AND TECHNICAL EDUCATION HAS BEEN SPECTACULAR. IN 1958 THE TOTAL ENROLLMENT WAS 4,144 STUDENTS. IN 1960 ENROLLMENTS HAD INCREASED TO 5,319. IN 1962 ENROLLMENTS HAD INCREASED TO 11,284. IN 1966 TO 19,584 AND IN SEPTEMBER, 1968, 27,700. ENROLLMENT PROJECTIONS INDICATE THAT BY 1975 THESE ENROLLMENTS WILL EXCEED 50,000 DIFFERENT INDIVIDUALS.

PROGRAM DEVELOPMENT, AS PREVIOUSLY POINTED OUT, IS BASED UPON THE EMPLOYMENT NEEDS OF THE STATE. EMPLOYMENT OF GRADUATES IS GENERALLY IN THE FIELD OF TRAINING AND IN MANY CASES STUDENTS HAVE THEIR CHOICE OF WELL PAYING JOBS.

BUSINESS AND INDUSTRY EAGERLY SEEK THE GRADUATES OF WISCONSIN'S POST SECONDARY VOCATIONAL AND TECHNICAL PROGRAMS BECAUSE, THEY STATE, THESE GRADUATES ARE SUPERIOR IN MANY WAYS IN MEETING BUSINESS AND EDUCATIONAL NEEDS THAN ARE GRADUATES OF FOUR YEAR INSTITUTIONS.

FINANCIAL SUPPORT FOR OUR PROGRAM HAS ALSO KEPT PACE WITH EXPANDED ENROLLMENTS. IN 1958 STATE AID WAS APPROPRIATED IN THE AMOUNT OF $900,000 FOR THE BIENNIUM. THE 1969-71 BUDGET OF THE STATE BOARD, WHICH HAS BEEN APPROVED BY THE COORDINATING COUNCIL FOR HIGHER EDUCATION FOR SUBMISSION TO THE 1969 LEGISLATURE, INCLUDES STATE SUPPORT FOR THESE PROGRAMS OF $21,000,000. IT IS INTERESTING TO NOTE THAT THE BUDGET REQUEST SUBMITTED TO THE COORDINATING COUNCIL FOR HIGHER EDUCATION FOR SUPPORT DURING THE COMING BIENNIUM WAS THE ONLY ONE WHICH WAS NOT REDUCED.

IN MY DISCUSSION OF THE POST SECONDARY PROGRAM IN WISCONSIN, I HAVE REFERRED TO SEVERAL DIFFERENT TYPES OF INSTITUTIONS. THESE INCLUDED THE TECHNICAL COLLEGES OPERATED IN THREE CENTERS IN THE STATE WHICH OFFER BOTH LIBERAL ARTS TRANSFER AND VOCATIONAL AND TECHNICAL PROGRAMS, AND THE TECHNICAL INSTITUTES ESTABLISHED IN FIFTEEN LOCATIONS WHICH DO NOT INCLUDE THE LIBERAL ARTS PARALLEL TRACK. IN ADDITION, WE HAVE SATELLITE SCHOOLS IN SEVERAL COMMUNITIES IN THE STATE WHICH PROVIDE LIMITED OFFERINGS ON A FULL-TIME BASIS, GENERALLY TO RESIDENTS OF THE IMMEDIATE AREA.

IN WISCONSIN MUCH CONCERN HAS BEEN EXPRESSED DURING RECENT YEARS OVER THE POSSIBLE DEVELOPMENT OF A COMMUNITY COLLEGE SYSTEM WHICH WOULD EMPHASIZE THE FIRST TWO YEARS OF LIBERAL ARTS TRANSFER EDUCATION AND REDUCE EMPHASIS ON OCCUPATIONAL PREPARATORY PROGRAMS. EXAMPLES ARE POINTED TO IN OTHER STATES WHERE THE TWO YEAR POST SECONDARY INSTITUTIONS WHICH COMBINE BOTH LIBERAL ARTS AND TECHNICAL EDUCATION GIVE MAJOR ATTENTION TO TRANSFER PROGRAMS AND HAVE MINOR CONCERN FOR THE OCCUPATIONAL TRAINING NEEDS OF THE PEOPLE IN THE COMMUNITY AND AREA. EVERY ATTEMPT IS BEING MADE IN WISCONSIN TO CONTINUE A MAJOR EMPHASIS ON VOCATIONAL AND TECHNICAL POST SECONDARY TRAINING PROGRAMS EVEN THOUGH AN

ACCREDITED LIBERAL ARTS TRANSFER PROGRAM IS CONDUCTED BY THE INSTITUTION. HOWEVER, CONSIDERATION IS BEING GIVEN TO THE POSSIBLE ESTABLISHMENT OF A RATIO BETWEEN LIBERAL ARTS AND VOCATIONAL AND TECHNICAL OFFERINGS SO THAT THE IMBALANCE WHICH IS FEARED BY MANY OF OUR LEGISLATIVE LEADERS WILL NOT RESULT.

I HAVE EVERY CONFIDENCE THAT OUR SYSTEM IN WISCONSIN WILL CONTINUE TO DEVELOP POST SECONDARY PREPARATORY PROGRAMS WHICH WILL MEET THE NEEDS OF THE PEOPLE IN THE ENTIRE STATE. IT IS IMPORTANT THAT WE RECOGNIZE THESE NEEDS AND TAKE STEPS TO MEET THEM, DEVELOPING NEW PROGRAMS WHERE NECESSARY AND CHANGING PROGRAMS TO MEET NEW NEEDS BROUGHT ABOUT BY A CHANGING ECONOMY OR CHANGING SOCIAL CONDITIONS. IN THIS WAY WE WILL MEET THE CHALLENGES WHICH HAVE BEEN GIVEN IN THE RECENTLY ENACTED FEDERAL LEGISLATION.

NEED FOR DEVELOPMENTAL AND EXPERIMENTAL VOCATIONAL PROGRAMS AT THE POST SECONDARY LEVEL:

COPY

Remarks for Senator Ralph Yarborough, to be delivered as one of four presentations before the Post Secondary Departmental Program during the American Vocational Association Convention in Dallas, Wednesday, December 11, in the Embassy Ballroom of the Statler Hilton Hotel from 9 a.m. to 11:30 a.m.

Thank you. What I am about to say is reflective of what my colleagues and I on the Senate Education Committee learned during this past session of Congress. I am happy to report that because we learned, we acted; the Vocational Education Amendments of 1968 were the end product. It would not be unfair to say that in passing these amendments the United States Congress underwent some vocational education.

The topic you have asked me to address myself to is "The need for developmental and experimental

COPY

vocational programs at the post-secondary level." Assigning such a subject presumes that a need exists. The presumption is correct.

Perhaps the three most important lessons that were hammered home to the Committee during this past session were that:

1) the area of American education of the greatest overall importance has shifted from the secondary level to the post-secondary level;

2) Thousands of disadvantaged young people drop out of school before high school graduation; and

3) the manpower needs of our economy are becoming so highly technical, varied, and shifting that it is highly improbable that a single-purpose terminal secondary school training program can

COPY

adequately prepare students for a lifetime career.

Poastsecondary education has replaced secondary education as the terminal program for a majority of American young people. High school vocational programs should reflect this change. All to few have done so. The new technology has made many of the occupations for which high school training is adequate almost obsolete. The vast majority of American young people want to continue their education beyond high school. Why should they be enrolled in terminal training programs in high school?

Vocational programs can be of more use to these students if they are designed to prepare students for post secondary technical programs. Basic principles of applied science would be of

COPY

more use than lathe operation to a student who would like to continue his education.

Failure to recognize the shift from secondary to postsecondary education on the part of vocational educators has led to failure on the part of the general public to recognize the importance of technical education at the post-secondary level.

Young people, for whom a college education appears only a distant improbability, are in despair when they think of their future. The importance which has been placed upon a college degree in the marketplace is a disservice both to colleges and universities and to the young people who feel compelled to obtain a degree.

All too often the employer unrealistically

COPY

demands the college degree for its presumed social status value regardless of the actual job requirements. More adequate recognition should be given to a degree other than the bachelor's, such as those issued by the postsecondary 2-year institution. There is or should be room for a 4-year degree similar to those granted by polytechnic institutes that have been so successful in many European countries.

Post-secondary vocational and technical institutions are in a position to play a major role in the future of our society. These institutions are in a unique position--a position in which they can train young people to enter the labor market and at the same time offer an education to prepare

COPY

them to meet crises in skilled manpower arising from the rapidly changing technology and expanding economy.

A view of the occupations in which there is a current shortage of manpower will indicate the direction occupational education must take: physicians, nurses, health service personnel, teachers, social workers, engineers, draftsmen and mathematicians.

Projections of employment growth over the next 10 years indicate that the fastest growing occupational groups are professional and technical workers, service workers, clerical workers, and managerial and proprietary workers. It is possible in the not-too-far-distant future that our technology will have advanced to the point that all of the

COPY

present "skilled labor" occupations will be obsolete. Persons who are now in, or are tarining for, those occupations will have to be retrained unless they have an education which will permit them to change with the needs of the economy.

The recent period of revolutionary discoveries and innovations in science and technology has resulted in such an accumulation of knowledge that even scientists and engineers are threatened with inability to keep up with their fields. If this problem is facing scientists and engineers, persons in the occupations ancillary to those fields are faced with an almost insurmountable task in keeping up. This means that post-secondary vocational and technical schools are going to have to adapt to

COPY

continuing education programs in the technical fields. It means that education is going to become a facet of everybody's career which continues throughout an entire lifetime.

One of the most exciting areas of post-secondary training which is ripe for development and experiment is that of New Careers. The new Vocational Education Amendments containing a section I authored which provides funds for projects of research and training in the development of new careers and occupations--Section 132 (6).

The new careers I speak of are in public service-connected areas of the economy. They are careers in the sense that a young person is provided a job as a non-professional in such fields as

COPY

mental and physical health, drug prevention and correction, welfare, education, municipal services, child care, or recreation--to name just a few--and then is given training on-the-job. Perhaps part of his day is spent in a classroom type situation; most of it is spent working; working with professionals as an aide.

It would be possible for this New Careerist, concomitant with training and experience, to move up a career ladder. At the heart of the New Careers concept is the "ladder"--the structuring of tasks and responsibilities in sequence so that the gradations between tasks are not too great--but are great enough to warrant an increase in salary and status. Thus, a young woman might enter a New

COPY

Careers program in conjunction with a junior college and a local hospital and, over a period of time not only obtain high school credit but credit for college level courses--and at the same time become a licensed practical nurse, or a registered nurse.

The potential of New Careers is great; but it needs work--it needs development and experiment. Beyond the potential for New Careers being great, the need for it is even greater. In February, 1966, the National Commission on Technology, Automation, and Economic Progress estimated that there were 5.3 million potential sources of new jobs through public service employment. Couple that with the pronouncements which come at us almost daily that by 1975 or 1980 the shortage of trained teachers, of trained nurses, or trained policemen

COPY

will be overwhelming and the taxpayers becomes a most important and significant undertaking.

It should be the men and women here at this conference who assume a leadership role in this field, for this field is the future; virtually all of the increase in employment from 48 million in 1947 to some 75 million at present has occurred in the service areas of the economy: Hospitals, schools, social work, and many fields of business, while employment in the production of goods has remained relatively stable.

By passing this New Careers amendment, Congress recognized that there is a need for developmental and experimental vocational programs at the post-

COPY

secondary level.

And by passing the new part D of the amendments: "Exemplary Programs and Projects" Congress pushed in exactly the same direction that I sense the vocational education community wants to move. Permit me to read the introductory section of part D, for I believe it sums up most concisely what the Committee learned:

"The Congress finds that it is necessary to reduce the continuing seriously high level of youth unemployment by developing means for giving the same kind of attention as is now given to the college preparation needs of those young persons who go on to college, to the job preparation needs of the two out of three young persons who end their education

COPY

at or before completion of the secondary level, too many of whom face long and bitter months of job hunting or marginal work after leaving school. The purposes of this part, therefore, are to stimulate, through Federal financial support, new ways to create a bridge between school and earning a living for young people, who are still in school, who have left school either by graduation or by dropping out, or who are in postsecondary programs of vocational preparation, and to promote cooperation between public education and manpower agencies.

In sum, it seems to me that this is a very exciting time for vocational education--and for post secondary vocational education in particular. The simple realization that continuing education

COPY

is going to become a factor of more and more importance in vocational education, and the understanding that the field of New Careers holds great promise, taken alone would indicate that YES, there is a great need for developmental and experimental vocational programs at the post-secondary level.

Acknowledging that need, the time has come for action. I am confident that when the Vocational Education Act once again comes before the Congress in 1973, action will have been taken and the promise of post-secondary vocational education will have come true.

Thank you.

THE ECONOMICS OF VOCATIONAL EDUCATION AT THE POST-SECONDARY LEVEL*

SUMMARY OF COMMENTS

By

Alvin B. Wooten
Professor of Agricultural Economics
Texas A&M University

Our founding fathers in creating a democratic form of government emphasized the fact that an educated citizenry was essential to the successful operation of such a government thus establishing the basis for and encouraging a public educational system more comprehensive and with greater impact on the life of each citizen than could have been imagined at the time. Through the years our educational system has been subjected to a two-fold pressure which is more acute today than ever before: to the pressure of numbers and at the same time to the pressure exerted by the advances of technology in a world for which education must prepare people. Education has become a mass problem, it takes on an economic dimension by reason both of the resources it absorbs and of the training demands it is required to meet. Along with its accepted task of developing the personal abilities of each individual it now has to ensure adaptation to economic requirements both in the interest of the individual and in the interest of society.

Economists are particularly interested in education because of its substantial impact upon the productivity of people as a labor input into

---

*Presented at the American Vocational Association Convention in Dallas, Texas, December 11, 1968.

our production process and its impact on people as ultimate consumers of the production. We would expect that vocational education would have its greatest impact directly upon the quality of a man's labor and only indirectly upon his consumption habits.

Education, particularly vocational education, can accelerate major improvements in our production process by:

1. making people more receptive to new techniques and innovations,
2. promoting the specialization and intensification of labor use with machinery,
3. promoting labor mobility geographically and between industries,
4. insuring that those individuals who are responsible for making major technical and economic decisions possess the knowledge which enable them to avoid costly mistakes.

Economists have long been puzzled by the fact that the observed rate of growth in output in an economy was much greater than the rate of increase in the principal resources of land and capital that were measured. In the last decade it has become clear that the "X factor" omitted from the calculations was the increase in the quality of the labor resource being used. This increase in quality is attributable to the general and vocational educational system. In his "Reflections on Investment in Man" T. W. Schultz maintains that man's economic capabilities are predominantly a produced means of production and that, except for some differences in inherited capabilities, most of the differences in earnings are the result

of differences in the amounts that have been invested in people through education and other social services.

The United States has long led the other countries of the world in its per capita expenditures on general education. It has been among the leaders in the proportion of its national income that is allocated to education. However it lagged far behind the other developed countries on the amount of expenditures for vocational education. According to the latest information available, the United States has devoted less than one percent of its educational expenditure to other than primary, secondary and higher education, while countries such as Germany and Belgium were devoting 15 percent and 24 percent respectively to vocational education. This probably is not a true picture since much of the expenditure on vocational education in the United States is included in the secondary and higher education categories. It does however point up the lack of emphasis placed on post-secondary vocational education in the United States.

Professor E. F. Denison of the Brookings Institution in Washington, D.C., has made a major study, "Measuring the Contribution of Education to Economic Growth," which points up vividly the need for post-secondary vocational education. He says that from 1929 to 1957 the real national income increased at an annual rate of 2.93 percent. He estimated that 73 percent of the national income was represented by the earnings of labor and managers, while earnings of land is 4.5 percent and capital 22.5 percent. During this same period the quality of labor increased by 30

percent primarily due to education. He then asks the question, what would be the easiest way to increase real national income by $20 billion by 1980? Since labor is the major input in our production process the $20 billion increase could be obtained if anyone of the following could be accomplished:

1. prevent half the deaths that would otherwise occur between now and 1980 among individuals less than 65 years of age; or
2. cut in half time lost from work because of sickness and accidents; or
3. draw into the labor force one-tenth of all able-bodied persons over twenty years of age who will not otherwise be working in 1980; or
4. double the rate of net immigration over the next twenty years; or
5. operate with a work week one hour longer than otherwise; or
6. add one and a half years to the average time that would be spent in school by everyone completing school between now and 1980, or make equivalent improvement in the quality of education.

Certainly all of these alternatives may not be attainable in the time under consideration nor or they necessarily additive in their impact on national income. However, if we could choose only one--draw into the labor force one-tenth of all able-bodied persons over twenty years of age who will not otherwise be working in 1980--as a focal point of attack with vocational education programs for the next decade it seems reasonable to believe that this goal could be accomplished.

One of the great dilemmas of our time is the transformation of our citizens from an overprotected, inexperienced, untrained adolescent to

an economically and socially productive adult. This transformation period continues to grow shorter and the technical requirements for effective production grow greater.

We often forget that in a capitalistic economy there are three basic ways for people to earn a livlihood. A man can own land and receive an income for its use. He can own capital goods and receive on income for their use. Owning neither of these he must sell his labor. In an industrialized economy such as ours untrained labor is not readily marketable and will be at a greater disadvantage in the future. Labor untrained and unused is not only disastrous for the individual associated with it but certainly is a serious loss for the economy.

Vocational education programs cannot only convert untrained labor into a useful product for economic growth but can accomplish this task in a shorter time period than other known methods. The evidence seems to indicate quite clearly that our economic progress can be stimulated to a greater degree, in a shorter period of time and with fewer resources invested by increasing the quality of our labor resource through vocational education programs than any other method.

A MODEL FOR CONTINUOUS EVALUATION OF VOCATIONAL PROGRAMS BY STATE DEPARTMENTS OF EDUCATION

By

Harold Starr, Ph.D.

The Center For Vocational and Technical Education

The Ohio State University

Prepared For The Program On Evaluation,

Department of Research and Evaluation

AVA Convention

Dallas, Texas

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

A Model For Continuous Evaluation of Vocational Programs By State Departments of Education

The Center For Vocational and Technical Education at The Ohio State University is currently involved in the development of an evaluation model designed to assess the effectiveness of state programs of vocational education. The central purpose of this evaluation effort has been to develop instruments and procedures which can be utilized in the administrative mainstream as a means for contributing essential information required in decision making for state vocational education program planning.

The focus of the project has been on the development of evaluation instruments and procedures which can enable a state vocational education agency to assess, on a continuous basis, the effectiveness of its vocational education efforts in terms of national and state interests, student benefits and manpower requirements.

The Center is concerned with the importance of the periodic evaluations called for in the National Vocational Education Act. It also recognizes the pressing need for evaluation and program planning methodologies to meet the accountability requirements set by this act as well as by state vocational education agencies, governing boards, state legislatures, and the public. Thus, The Center, by achieving its aim of developing a self-initiated evaluation system for state level usage, should provide a vehicle whereby essential information can be made more readily available to governmental agencies and the public while meeting the need for a mechanism to assist states in their program planning activities.

The present evaluation system was conceptualized after a review of existing evaluation system methodologies. This review of the literature indicated that vocational educators have long been concerned with the need for the evaluation of vocational education and training efforts for improving the effectiveness of vocational programs. In almost all instances the evaluation techniques employed have concerned themselves with assessing by expert opinion the adequacy of organizational structures, educational processes, and program activities, whether at the state agency or local school levels in terms of standards of goodness using judgmental procedures. Effectiveness measures have usually been neglected in these evaluation procedures. These "process" evaluation studies seem to assume that when vocational programs meet accepted standards in terms of curricula organization, staff organizational activities, and physical facilities, desirable program outcomes would inevitably ensue. Little attention has been directed toward verifying this assumption. Process evaluations, in themselves, do not gauge program effectiveness. Traditional vocational program process evaluations conducted at the local level do not provide the type of data required by state vocational education agencies for rationally redirecting programatic efforts at the state level. To be useful in state program planning, an evaluation system requires the formulation of measurable objectives against which to gauge program effectiveness. Most currently existing evaluation procedures in vocational education do not provide this essential methodological component.

In consideration of these factors, The Center has undertaken the design of a viable evaluation model for the assessment of state programs

of vocational education which provide measurable indices of program effectiveness in terms of specific, predetermined objectives. The Model focuses on the dynamic mix between program processes and activities, educational product outcomes, target population characteristics and additional data inputs required in the program planning process. The continuous input of evaluation data will signal the need for programatic change. Examples of these signals will be such factors as changes in the pouplations to be served, fluctuating manpower requirements, changes in program effectiveness indices or the failure of program objective outcomes to reach projected levels. Because of the nature of the Project, it was desirable in the initial stages to have significant involvement of agencies, groups and individuals external to The Center. Thus, two national advisory committees were utilized to react to project developments. One committee consisted of state directors of vocational education selected by the National Association of State Directors within the American Vocational Association; the other committee consisted of recognized authorities in the vocational education profession whose areas of expertise included teacher education, research, supervision and administration. Meetings continue to be scheduled with staff from the U. S. Office of Education. A review of the report and recommendations of the National Advisory Council on vocational education provided an additional source for data inputs into the Evaluation Model.

To insure that the Model would be practical and useful, the cooperation of several states was elicited to assist in field testing the program objectives, evolving data set and program planning procedures. The state directors of vocational education of Colorado, Kentucky and New Jersey entered into an agreement with The Center whereby they each identified a full-time, jointly-funded evaluation specialist to be available for work-

shops at The Center and to assist Project staff in carrying through the field test procedures in the states.

The first step in the development of the Model was the formulation of a set of program goals for vocational education from which measurable program objectives and finally an actual data set could be organized. In the Fall of 1967, a set of six state level program goals was mailed to state directors of vocational education and head state supervisors within each state department of education. The returns from this national survey were evaluated and a finalized set of five state level program goals were produced. These goals for vocational education are as follows:

Program Goals

1. To provide vocational-technical education and training to youth and adults who will be entering the labor force and to those who seek to upgrade their occupational competencies or learn new skills.

2. To provide comprehensive curricula which relate general and vocational-technical education offerings to the vocational objectives of students.

3. To provide increased accessibility to programs of vocational-technical education to meet the needs of those to be served.

4. To provide quality instructional programs which meet the vocational aspirations of people while being compatible with employment opportunities.

5. To provide a systematic and continuous evaluation of vocational-technical education in terms of national and state interests, student benefit, and manpower requirements as a means for making decisions concerning alternative investments of human and economic resources and the redirection of program objectives.

For each goal, a set of program objectives was formulated. These objectives are used to measure the extent to which goal achievement is

realized. Key program need indicators were formulated and these were simply computed measures of the gap between projected and actual program objective outcomes. Examples of such objectives for a given goal are as follows:

GOAL I

TO PROVIDE VOCATIONAL-TECHNICAL EDUCATION AND TRAINING TO YOUTH AND ADULTS WHO WILL BE ENTERING THE LABOR FORCE AND TO THOSE WHO SEEK TO UPGRADE THEIR OCCUPATIONAL COMPETENCIES OR LEARN NEW SKILLS.

OBJ.	
A	____ employment-bound secondary school students are enrolled in vocational education programs.
B	____ adults identified as requiring vocational education to increase their opportunities for securing or retaining full-time employment are enrolled in vocational programs to meet their needs.
C	____ adults in full-time employment whose rate of pay is below the federal minimum wage standard are identified and enrolled in vocational education programs to meet their needs.
D	____ adults identified as having mental or physical handicaps which act as barriers to their securing full-time employment are enrolled in vocational education programs to meet their needs.

A data set was then developed for each objective. The data system was designed to avoid the necessity of requiring local school visitations, and was organized by program level, vocational service area and, where applicable, by facility type, sex, grade level and by "district". A district as used in this Project refers to a geographical subdivision of the state whose economic and social cohesiveness warrants its receiving separate attention in terms of educational program planning. The data set contained both process and product measures.

The program planning phase of the Model involved the formulation of procedures to utilize data results for initiating projected plans of activities in terms of vocational education agency goal and program objective priorities. These procedures would need to consider, in addition to data results, such constraints upon the Vocational Education Agency as personnel resources, potential funding levels and competing service area needs, among others. The evaluation results and the internal and external agency constraints provide a basis for developing strategies to achieve projected levels of accomplishment.

Field testing of the initial data set and program planning procedures took place between February and May of 1968. It was evident from this reality check that the program objectives and the data set required revision in order to increase the Model's operational effectiveness. Because of time limitations and prior agreements with the states, field testing of the data set involved only data already available at the state agency and did not require involvement of local schools. The program planning procedures were reviewed with the pilot state staffs for their reactions.

No attempt was made to formally work through this phase of the Model because the amount of evaluation data actually available for adequately testing the program planning procedures was too limited.

The experience gained in the initial development and field testing of the Evaluation Model provided The Center Project staff with the needed background for improving the effectiveness and efficiency of the Model. The Evaluation Project has been refunded for the period November, 1968 to March, 1970. The major aims of the continuation project are to refine the data collection instruments and procedures and to introduce machine processing for data analysis.

At the present time the program objectives and the data set have been revised. Data collection instruments have been developed and these will be pilot tested in several local schools in the states of Colorado and Kentucky during January, 1969. These instruments are designed for data processing procedures. The present timetable for the Project calls for state-wide collection of data to be accomplished immediately following the close of the school year in June. The data collected in the two pilot states will then be forwarded to The Center for analysis. The program planning procedures will be tested during the Summer of 1969. A final revision of the materials will then be accomplished on the basis of the field test tryouts and the final product readied for widespread distribution.

Cost-Effectiveness Analysis as a Method for the Evaluation of Vocational and Technical Education

by

Jacob J. Kaufman

Professor of Economics and Director,
Institute for Research on Human Resources
The Pennsylvania State University

A paper presented at the annual meetings of the American Vocational Association in Dallas, Texas on December 10, 1968. It is based, in part, on views expressed at a conference sponsored by the Upjohn Institute, at Atlantic City on October 8, 1968.

Some aspects of the research reported in this paper were performed pursuant to a grant from the U. S. Office of Education. The points of view expressed do not necessarily reflect any approval, policy, or opinion of that office.

Cost-Effectiveness Analysis as a Method for the Evaluation of Vocational and Technical Education*

It is the purpose of this paper to discuss cost-benefit analysis in terms of (1) its logic and meaning; (2) some of the misconceptions which prevail concerning this method of evaluation; (3) some of the problems and limitations of this method; and (4) the conclusions of a study, conducted by the Institute for Research on Human Resources at The Pennsylvania State University, which attempted to determine whether or not there is pay-off from an investment in vocational and technical education.

Logic and Meaning of Cost-Benefit Analysis

Under a free enterprise economy most private wants are satisfied through the workings of the market mechanism. Under this system it is assumed that, as a result of consumer choice, goods and services will be produced to satisfy these private wants and that the limited resources of the economy will be allocated through the operations of the market in a manner which will yield the greatest output with a minimum use of resources.

---

* In the preparation of this paper the author had the assistance of Anne F. Brown and David Gumpper, Research Assistants.

There are, on the other hand, certain needs and wants which cannot, (or society prefers not to) be satisfied by the private sector. Certain wants, described as social wants, are those which "must be satisfied by services that must be consumed in equal amounts by all." These services are such that some people can benefit from them even if they do not pay for them. And there is no reason to think that such persons would make voluntary payments. Governmental expenditures of this type might include expenditures for flood control, defense, sanitation, etc.

Another group of wants which could be provided by the private sector but, for a variety of reasons, are handled by the public sector because society considers them meritorious, may be referred to as "merit" wants. Included in this category are such items as low-cost housing and "free" education. In these instances the wants could be satisfied by the private sector but society apparently thinks that there are certain social benefits which flow from these activities and therefore society should assume the responsibility to satisfy these wants.

It is not the purpose of this paper to discuss the pro's and con's of whether the government should concern itself with these "merit" wants. But it is the purpose of this paper to concern itself with the method by which it can be determined whether the provision of certain social and merit wants by the government are carried on efficiently, consistent with the objectives for which it has assumed the responsibility. And by efficiency is meant the attainment of an objective at the lowest possible cost.

In the private sector of the economy the market place, in general, is the place where these evaluations take place. The inefficient firm may have to go out of business. The firm that does not produce goods and services which satisfy the needs of the consumers may not survive. But what tests for efficiency and survival do we have when the government provides the goods and services?

The only alternative to the market place for the purpose of testing the efficiency of production or the quality of the product is by cost-benefit or cost-effectiveness analysis. Such an analysis is nothing more than an attempt to establish the equivalent of a system of market principles for various types of government activities. It might be reasonable to assert that the method of analysis is crude and that adequate data are not available. Such charges, however, do not negate the necessity to develop appropriate tools and to obtain data to judge a particular government activity.

The fact is that there is a tendency on the part of some educators to talk simply in terms of the "needs" of education. Their position is simple: the governmental agency should raise whatever funds are necessary to meet these "needs". On the other hand, there are some politicians who assert that there is a fixed sum of money available for educators to spend on education. The fact is that one should not talk about education in terms of cost or needs alone. No cost can be justified without a reference to payoff. And the satisfaction of any need cannot be justified without reference to cost.(1)

---

(1) See Charles J. Hitch and Roland N. McKean, The Economics of Defense in the Nuclear Age, Atheneum Press, New York, 1965, pp. 46-47.

This means that one cannot discuss the need for or the payoff from vocational education without relating them to costs. Nor can one talk about the costs of vocational education without relating them to payoffs. If private vocational schools survive it is reasonable to assume that these schools operate at a profit and that the private sector of the economy is willing to pay the price of tuition. It is not unreasonable to assume, further, that the buyers of the education find that it pays off. We can also assume that the profit motive will be a sufficient stimulant to the owner of the private vocational school to keep costs as low as possible.

But what controls do we have over the public education? What incentives are there for the public educator to keep his costs down? What evidence is there that public education is being provided efficiently? What evidence is there that the objectives are being achieved?

It is being suggested that these are legitimate questions to ask during a period in our society when there are many demands for the provision of social and merit goods by the government. And, even within education, there are many demands for different forms of education. This means that decisions must be made as to the allocation of resources among competing educational programs. The only appropriate method for making these decisions is on the basis of a cost-benefit analysis.

One aspect of cost-benefit analysis which should be stressed is that it is basically a "way of thinking". It tends, first, to force an administrator to think through his objectives. This does not mean

that the objectives are easy to state. Too frequently they are expressed too broadly and do not reflect the "real" objectives. It is not enough, for example, to state that the schools educate for the so-called "whole man". We must be more specific. Nor can it be stated that, for example, vocational education is designed to place a youngster in a job. Is it a job related to his training? Is it a job solely in terms of an initial placement or are we concerned with the duration of the job? Is it simply the first job or a series of jobs? Is it a job that leads to promotion? Is it a job that is satisfying to the graduate?

Second, cost-benefit analysis, as a "way of thinking", tends to force an administrator to concentrate on costs as well as objectives. The point need not be repeated that inputs and outputs are interrelated.

Third, cost-benefit analysis, as a "way of thinking", forces an administrator to think in terms of "alternatives", that is, to think in terms of alternative ways of achieving the same objective. To refer to the satisfying of wants in the private sector again, it should be noted that the pressures of competition tend to force private enterprise to seek other and better means of producing a good or a service. Similarly, the concentration on alternatives forces the educational administrator to seek other and better means for the education of youth. In this way we can get change and innovation in education. In fact, it is the failure to evaluate educational curricula that leads to stagnation. It is only through constant evaluation that we can obtain innovation.

The above comments are designed to indicate in a constructive manner the logic and meaning of cost-benefit analysis. Despite what appears to be a rather logical case for this type of analysis there is still considerable opposition to the technique. Such opposition reflects, first, certain misconceptions about the method. Second, educators have a different (and erroneous) view of evaluation. And, finally, educators view evaluation as a threat to their institutions. Each of these points will be discussed briefly.

Misconceptions of Cost-Benefit Analysis

One of the most serious misconceptions about cost-benefit analysis is that it is merely a subterfuge for seeking to conduct education on a "least-cost" basis. This is a complete misunderstanding of the notion of efficiency. To an economist efficiency means the achievement of a given objective with the least cost or the maximization of a given objective with a given cost. Efficiency combines both input and output.

A second misconception is that benefit is measured only in dollar terms, and that this is a form of crass materialism. Cost-benefit analysis recognizes that there are non-economic benefits which should be taken into account. Such non-economic benefits may include voting behavior, job satisfaction, cultural values, etc. However, it is essential these objectives should be established on the basis of decisions of the community to determine whether it wants to spend its funds (and how much) for the explicitly stated objectives, economic or non-economic.

A third criticism usually advanced against cost-benefit analysis is that there are some things that are not quantifiable. Presumably, this means that there is no way in which one can determine whether or not a given objective has been attained. If this is so, what justification exists to continue expenditures for objectives which cannot be quantified? Why the assumption that non-quantifiable objectives are automatically good? Although certain objectives may be difficult to quantify, every effort should be made to develop "inferential" (or proxy) indexes. For example, the extent of "interest" of students in a curriculum might be inferred from an index of absenteeism. Psychologists can be of great assistance not only in the development of such indexes, but also in the creation of the necessary instruments designed to compute them.

A fourth criticism frequently mentioned is that the cost-benefit technique has not been fully developed and, therefore, should not be applied. The first part of the statement is correct, but the conclusion does not follow. The fact is that once a decision is made to spend more on, say, vocational education an <u>implicit</u> decision has been made that the benefits exceed the costs. Therefore, the issue is not whether cost-benefit analysis should be applied to vocational education. It is being done every day when an educational administrator decides to spend a dollar on vocational education rather than on another type of education. The only question is whether the vocational education administrator should be required to state <u>explicitly</u> the manner in which he arrived at the decision. When the process of decision-making is made

explicit then others have an opportunity to judge the correctness of the process. It is only in this way that better decisions can be made on the allocation of limited resources for educational objectives. The rejection of an explicit cost-benefit analysis simply means a refusal to expose oneself to an evaluation of a decision-making process. In a democratic society this is unacceptable. In a democratic society the notion that the expert knows best is not tenable.

Fifth, there is a misconception that the cost-benefit analyst substitutes his judgment for that of the decision-maker. The analyst may ask the administrator some pertinent (possibly impertinent) questions. In no instance, however, does he substitute his values for those of the administrator. The analyst simply provides information--costs and benefits--of alternative lines of action designed to achieve the objectives as outlined by the administrator. The analyst simply assists the educational administrator in meeting the objectives of the community in the most efficient manner.

Finally, it is sometimes argued that cost-benefit analysis tends to ignore political considerations. Although the analyst ignores the political aspects of a program it does not necessarily follow that the decision-maker should ignore "politics". This type of analysis will, however, tend to reveal the cost of a political decision and may well tend to minimize the role of politics in the decision-making process.

The Meaning of Evaluation

The literature on the subject of evaluation is overwhelming. And it is not the purpose here to review this literature. However, the term "evaluation" appears to have several commonly accepted meanings. One must make it clear from the outset in what sense the term is employed in order to avoid misunderstanding. In terms of definition, evaluation must be separated from closely related concepts with which it is often confused.

A major distinction must be made between evaluation of individuals and evaluation of processes. Most educators still tend to think of evaluation only in terms of testing, or in terms of discriminating among individual students for administrative or instructional purposes. Indeed, most of the professional literature concerning evaluation uses this concept as its focal point. This probably reflects the fact that most publications in the area have been done by educational psychologists, who are mainly concerned with problems of testing. Another type of evaluation is on an evaluation of the educational process as it is carried out within certain institutions (i.e., within certain schools or school systems). The goal is not the assessment of the individuals but rather the assessment of the progress of all students within a program and the determination of reasons for the relative success of various aspects of this program.

The definitional problem centers around a distinction between measurement and evaluation. To a large extent these two terms are used as equivalents by educators. But the distinction between the two is

important. Measurement implies only quantity, while evaluation implies quantity plus quality. Measurement is a necessary part of evaluation, but evaluation requires both pre-measurement and post-measurement considerations. Before measurement commences, evaluation requires the formulation of a basic educational philosophy (and its attendant goals) and the statement of specific behavioral objectives to be measured. After measurement is completed, evaluation requires (1) the analysis of measured quantities in terms of the attainment of objectives and progress toward goals, (2) an estimate of the value of existing programs in determining this progress and (3) an estimate of the costs involved in the conducting of these programs.

Resistance to Evaluation

We live in a world of rapid change. Within the past half-century, the pace of technological and social change has increased tremendously. In the face of this, the educational establishment still tends to resist change. This resistance is perhaps best exemplified by the rates of development and acceptance of evaluation techniques. The first large scale attempt at evaluation was the National Study's development of the Evaluative Criteria, about thirty years ago. Since then, the criteria have been updated somewhat, but still are largely in their original format. Few other substantial techniques have been devised, and those which are available are utilized mainly for special research projects rather than for ongoing evaluations by interested school districts.

Apparently one of the major obstacles to evaluation research is the interest in the maintenance of a program held by its administrators. Many school administrators seem to view evaluation as an attack upon their institutions, and they erect a shield of defensive attitudes against such an event. This circumstance arises as a result of a failure to separate conceptually the particular educational institution from the process of education which goes on within it. These are two quite different entities, yet both administrators and evaluators too often neglect to view the situation in this manner.

The purpose of evaluation is to point out the strengths and weaknesses of a process, not to police the institutions in which the process occurs. But much of the evaluative effort appears to be just such a policing action. It has been shown that evaluators have been trying to get along with data of an administrative type (such as average class size, average teacher salary, etc.) rather than data of a process type. From these considerations, there would seem to be two paths to greater acceptance of evaluation. One of these is to assure the school administrator that the evaluation is to be used to study the process of education within his school and to help him improve this process, and that it is not to be used for the purpose of making value judgements about his school. The other path to acceptance lies in following up this assurance by utilizing evaluation procedures which really are aimed at collecting only those data relevant to the educational process. In doing so, the evaluator may have to give up some data he would like to have

but the increased acceptance and cooperation should more than make up for this. Much of the data which are presently collected under the guise of evaluation is mainly used to sustain the existing state and national educational bureaucracies; their educational relevance may be quite low.

Furthermore, even when the process is being evaluated little or no consideration is given to costs, a necessary ingredient in any evaluation process.

The remainder of this paper will summarize a recent study of cost-effectiveness of vocational education.

Objectives of Cost-Effectiveness Study

This study of the cost-effectiveness of vocational education had two fundamental objectives. First, it was designed to develop an appropriate methodology for the conduct of such a study. Second, it was designed to obtain data in order to demonstrate the extent to which a study can actually be carried on, and to indicate the magnitude and direction of results. In this paper the former will be ignored and consideration will be given the second objective.

In order to determine the optimum allocation of public resources in education in general and between vocational-technical education and alternative curricula for non-college attending students in particular, measurement is needed of both costs and benefits. Costs by themselves can neither be taken as an indication of quality, nor can benefits be evaluated without taking account of costs. Thus, although costs and benefits are discussed separately, no conclusion as to the worth of the two curricula can be made until the relationship of costs with benefits is considered.

Cost data were obtained from senior high schools in two cities. The current cost of instructing an additional student, that is, the marginal cost, was shown to be greater in the vocational-technical senior high school curricula than the respective costs for the nonvocational-technical senior high school curricula. The difference was between 100 to 200 dollars. Thus, unless the benefit obtained from the vocational-technical senior high school curricula was much greater than from the nonvocational-technical senior high school curricula, it is possible that the nonvocational-technical senior high school curricula are more worthwhile, and should receive a greater allocation of funds. This will be examined later.

An analysis of cost data can also reveal the optimal scale of operation of a senior high school, that is, the level of output, in this case average daily attendance, at which average cost is a minimum. If the statistical results derived in this study are reliable, the optimal scale of size of a nonvocational-technical senior high school is about 3,000 students, although there is a considerable margin of error. No optimal scale of size could be determined for vocational-technical senior high schools because of the small number of observations in this study.

It is important to know the optimal scale of operation because in performing the cost-effectiveness study it is assumed that each school is operating at its most efficient point, and that costs can only be reduced by changing the allocation of funds between curricula, and not by changing the size of the school. Further studies may give greater justification to this assumption.

The benefit data were based on labor market histories reported by mail questionnaires from a sample of high school graduates. Earnings and employment were used as proximate measures of benefit because of the absence of a unique objective measure. After making allowances for variations in the socio-demographic characteristics of the sample, it was shown that nonvocational-technical graduates earned less than vocational-technical graduates during the first year after graduation. By the sixth year, however, the difference in earnings between curricula was slight. Over the long run, the graduate's performance in the labor market is highly related to his labor market experience and socio-demographic characteristics, rather than to the kind of training received in the relatively distant past.

Nevertheless over the six years, given that both sets of graduates have the same socio-demographic backgrounds, vocational-technical graduates earned $3,456 more than graduates of the non-vocational-technical curricula. Similarly over the six years, vocational-technical graduates were employed 4.3 months more than graduates of the nonvocational-technical curricula.

Thus, for the study sample, given that earnings and employment are appropriate indices of the benefit of education, vocational-technical graduates earned significantly more and were employed significantly longer than the graduates of the other curricula during the six-year post graduate period. The vocational-technical curricula, therefore, not only costs more in relation to the nonvocational-technical curricula, but also

yields greater benefit. It is still not possible, however, to determine whether additional funds should be allocated to the vocational-technical curricula or to the nonvocational-technical curricula.

In order to analyze vocational-technical education as an investment in the human agent, the relationship between costs and benefits must be determined when taking account of time, depreciation, risk and uncertainty. Investment criteria are utilized for this purpose. There is no single one which is theoretically or practically correct for all investment situations. Each is limited by a different set of assumptions. In the study, therefore, several criteria were employed. Each of them, separately, showed that additional public funds should be spent on vocational-technical students rather than students in nonvocational-technical senior high schools.

It is asserted by some that students who might normally have dropped out when following the nonvocational-technical program might become successful graduates within a vocational-technical program. In this study the comparison can only be made for students of any curriculum who graduate and those of the same curriculum who drop out. Employment and earnings benefits of the dropouts were measured from the time when they would have graduated.

Over the six-year period, vocational-technical dropouts were employed 11.6 months more than the nonvocational-technical dropouts. The difference in employment between nonvocational-technical graduates and dropouts is greater than the difference between vocational-technical

graduates and dropouts. Thus, while nothing can be said about the dropout saving propensity of the vocational-technical curriculum, one may be able to assert that dropouts from this curriculum fare better in the market place than dropouts from other curricula. However this may be because vocational-technical students drop out in response to a perceived labor market opportunity, and not necessarily because of a fundamental inability to successfully complete high school.

Many consider that one of the major benefits of a vocational-technical school is the ability of these schools to rectify short-run shortages in needed skills. A total of 129 employers were interviewed and their replies indicated that on-the-job training for employees from vocational-technical senior high schools was on the average 12 to 64 weeks shorter than for other employees. For the firms in the sample which had any type of training program, vocational-technical training not only shortened the training program, but also resulted in a higher wage rate while in training. In fact, during the training period it cost employees of vocational-technical graduates about $245 less to receive the necessary training.

Both of the above factors give further justification to the major conclusion of this study--that additional funds should be allocated to the vocational-technical curricula--by indicating further benefits accruing to the vocational-technical curriculum which had not previously been taken into account. A final potential source of bias in measuring benefits to vocational-technical education may lie in non-monetary and non-economic factors. These were also examined.

An improvement in citizenship and an increase in social participation were considered as possible non-economic benefits resulting from different educational curricula. Voting behavior, in the 1966 primary elections and in the 1964 Presidential election, was assumed to be a suitable measure. It was shown that if this assumption is justified, curriculum does not have any significant impact upon citizenship or social participation. Career satisfaction was also considered as a possible benefit. It was shown that vocational-technical graduates had .28 fewer jobs that did not fit in at all with their career interests than did nonvocational-technical graduates. Thus vocational-technical training has in part done what it set out to do--to prepare workers for employment in specific skill areas, so workers do in fact find employment in their areas of training.

The evidence, therefore, suggested that there was little difference in non-economic benefits between vocational-technical and other curricula. Thus, the economic benefits, as discussed earlier, may represent a fairly close estimate of total monetary and non-economic benefits. Again, it can be said that, for the study sample, vocational-technical education is an economically worthwhile investment for individuals and for society.

However, although this study has shown that vocational-technical education is economically worthwhile <u>for this study sample</u>, one cannot necessarily generalize on the basis of these results. If further studies corroborate these findings, then generalizations can be made on safer ground, but considerable refinement is still needed of both concepts and data.

Research Policy: Should it be Determined by State Directors or by the Bureau of Research?
-A POSITION-

Joseph T. Impellitteri
Department of Vocational Education
The Pennsylvania State University

Presented at
The 62nd American Vocational Association Convention
Dallas, Texas
December 11, 1968

The role that I perceived myself filling in this session today was in providing some middle ground in this concern over research policy in vocational education. In writing this paper I attempted to fulfill that role in a similar fashion as I had in my younger football playing days as a defensive middle guard. In that role all I did was put my head down and churn forward. I usually kicked up a heck of a lot of dust, but very rarely tackled anyone. So it was with this paper. I plunged ahead, not knowing where my left tackle and right tackle were heading, and hoping I was staying between them.

My position, of course, has its advantages. In not knowing the positions represented at the so-called extremes, I can carve out for myself a comfortable middle ground, and accuse Arnold or Tuckman or both for either going too far or not going far enough. Resolving any of the issues confronting us in this session then becomes secondary to the gamemanship involved. I have thus chosen to plunge ahead like in the old days. I'll try to keep the dust down, but I won't promise a thing.

My remarks have been organized under four main headings: 1. "Setting the stage"; 2. "Let's take a look at the extremes"; 3. "Where is the middle ground?" and 4. "Some recommendations." Generally, what I've tried to do is to proceed from the question of, "Where have we been?" to "Where are we now?" to that of "Where can we go?" and finally to answer the question, "Where should we be going?"

It is not necessary for me to go into a prolonged discussion of vocational education's history. Most of you are well acquainted with it, and many of you are probably better acquainted with it than I. There are a few points I'd like to make regarding the implications of that history to our situation today.

First I'd like to focus on the traditional concept of vocational education as it has evolved. If I asked any of you if you are a vocational educator, you'd in all probability say, "Yes." Was not your educational and training background, however, either in an industry program, or an agriculture program, or a distributive program, or another one of the specialized service areas? Very few of us could answer no to that particular question. The reason is that vocational education has traditionally been organized and administered under that pattern at the state level and within university structures. Vocational education as a complex discipline within the educational system has, as a consequence, neither been acknowledged nor accepted. The effort of the graduate program at Rutgers (Professor Tuckman's institution) is one of the few encouraging exceptions to this pattern. We have been so occupied with feeding heavy doses of specialization to our students, that the substance included within the discipline of vocational education has been bypassed.

Within the last five years we have been encouraged in our research efforts to utilize interdisciplinary approaches. In doing so, in attracting the sociologist, psychologist or economist to work with us, how many have had to throw up their hands with frustration? "They just don't understand our field," is a typical comment. The fact is that interdisciplinary approaches which assume that a psychologist and a sociologist who know nothing about vocational education can work with a vocational educator who knows little about psychology or sociology are doomed to failure. What I hope this lesson has taught us is that we can no longer afford to neglect building breadth into our vocational education programs, breadth in the discipline, breadth in education and breadth in the related disciplines. With the encouraging passage of the Vocational Amendments recently, and

its accompanying bet that vocational education will be a partial cure to many of our major societal problems, how can we ignore what this implies?

The view of research in vocational education prior to the passage of the VEA of 1963 was primarily a social bookkeeping chore. The need for research was synonymous with the need for information. Research was perceived as a fact-gathering process. If a State director wanted to know what the graduates of secondary level reimbursed programs in the state were doing a year after graduation, he had somebody do some research. If a teacher educator felt it would be nice to know what the states were doing about certification for trade and industrial teachers, he sent out questionnaires to all the state directors.

When, in 1964 funds for problem-oriented research became available, where were the vocational educators who had the training and background to conduct such research? The AVA's research committee immediately became active in initiating a number of seminars designed to provide vocational educators with some minimal research competencies. When are we going to learn that we must build into our graduate programs experiences which make it possible for our students to acquire these competencies initially?

A common misconception which has evolved in our field is that the person typically called a researcher is perceived to be a technician, equipped with his bag of research tools, who goes hopping from problem to problem, toubleshooting his way through a maze of the practitioner's problems. This distorted view of the researcher does not acknowledge the importance of scholarly research to the discipline. It presupposes that the only important research in the field is research of the social bookkeeping type described previously. I maintain that the proper domain of the researcher in vocational education is in the area of scholarly research which contributes to the discipline

rather than to the solution of immediate problems. As Bereiter (1) has indicated, ". . . in allowing problems to determine research we skip over the vital step without which research is meaningless. Problems may motivate one to search for ideas, but it is the ideas which should determine the research." This position is also consistent with Travers' statement:

> Educational research conducted within an institution for solving local problems usually contributes little to the development of a body of knowledge of broad significance to education as a whole. The pressure to solve one local problem after another prevents the development of a broad program consisting of a series of related studies. (2).

The researcher as viewed in this framework is primarily a content specialist and secondarily a competent conductor of research. His conception of the content may be more abstract than that of the practitioner. However, his primary strength must lie in his knowledge and understanding of the discipline in which he is operating.

In discussing the determination of research policy I am assuming that such policy will affect only that research which is supported by federal dollars appropriated for research in vocational education. Let us examine the alternate possibilities for determining policy.

First, I'd like to discuss the Bureau of Research as a policy setting body. Most of you have either been involved with or at least are familiar with some of the interdisciplinary projects funded by the Bureau under the '63 act. Many of these projects allowed for only a nominal involvement of a vocational educator. Others showed no practical involvement at all. These studies were funded on behalf of vocational education apparently as a medicinal agent. That is, this might not taste too good to you now, but you'll later be thankful we gave it to you. Well, it's now later, and I don't see any great vote of confidence being offered by vocational educators yet. Maybe we should wait a while longer for the fruit bearing stage.

Actually I have no quarrel with the Bureau of Research. They placed their big bets on the proven performers rather than go with the longshots. It just so happens that the proven research performers were not vocational educators. More are now. Many more will be in the days to come. But we have awakened a little late. I truly believe that given a substantial number of vocational educators with sophisticated research competencies, the Bureau of Research would support their scholarly efforts. As I have already indicated, I see this as an area of desperate need in our field.

The State Director, on the other hand, undoubtedly perceives a different set of research problems and priorities. Necessity dictates the focus of research interest of the director. Since he deals with day-to-day, recurring educational and administrative problems he becomes attuned to the here and now, and feels strongly about the need for immediate answers. Although directors' need for research differ from that of the discipline, the former is extremely crucial. I thus propose that we can no longer refer to a global need for research in vocational education. The need, to me, seems to be two-fold: the need for research focusing upon immediate solutions to practical problems of the practitioner; and the need for research to focus upon the understanding of the underlying principles and theories upon which this complex is based. Therefore, there must be a share in the determination of research policy. In practice such a division of responsibility is accomplished by dividing the funds to be distributed for research.

EXPLORATION WITH A COMPUTER-ASSISTED OCCUPATIONAL INFORMATION SYSTEM*

Joseph T. Impellitteri
Department of Vocational Education
The Pennsylvania State University

Presented at
The 62nd American Vocational Association Convention
Dallas, Texas
December 11, 1968

*The project described herein was conducted with financial support and cooperation from the Pennsylvania Vocational Education Research Coordinating Unit and the Bureau of Vocational, Technical and Continuing Education.

Based upon the needs of today's youth to explore the world of work and the increasing importance of vocational guidance in their development, the Computer-Assisted Career Exploration System was developed. The purpose of the system is threefold: to provide an easily updated individualized occupational information retrieval system; to develop through an essentially heuristic approach a process whereby youth could develop their own individualized frameworks of the occupational structure; and to provide an experience for youth to acquire, by simulated practice, operational strategies in relating their abilities and interests to occupational opportunities.

The project was initiated on January 1, 1966 with financial support from the Pennsylvania Department of Public Instruction. In April, 1967 the first phase of the project, the development and debugging of the prototype model was completed. The student terminal provides the means by which a student interacts with the system. The terminal, tied into an IBM 1401 computer by telephone lines, is composed of a typewriter-like device, a tape recorder, and a slide projector, all under computer control.

The computer relates selected materials to the student, who is seated at the terminal, by either typing out a message through the typewriter, displaying a particular image on the slide projector, or by playing a previously recorded message on the tape recorder. The student relates meaningful messages to the computer by typing a short response on the typewriter. This short response required of the student is considered to be essential since longer typed messages would require a level of typing skill not ordinarily achieved by most ninth grade boys.

Information related to a certain students' abilities, preferences and educational plans are stored in the computer before the student begins the interactive phase. The student is oriented to the purposes of the system before he begins the first

session. At that time, he is given a list of 40 occupations with corresponding codes representing his primary entry into the system. The computer's first request to the student is to ask him to select one of the 40 occupations on the list about which he would like to know more. After the student responds by typing an occupational code number, the computer then types out a short paragraph very briefly describing the occupation. The student is then asked if he wishes to find out more about the occupation. If the student responds positively, four operations are activated in the following order: 1) discrepancies which may exist between the student's ability-preference profile and the requirements for the particular occupation are typed out; 2) a two-minute taped interview with a worker in the occupation is played; 3) an image is projected on the slide projector screen depicting the worker undertaking four typical tasks in the occupation and 4) a 150 to 200 word description of the occupation is typed out for the student to read, and to keep for later use.

The student is allowed to proceed through as many occupations as he wishes during as many 40-minute sessions as he wishes. He may, at any point in the process, indicate that he would like the computer to select for him those occupations from the list of 40 which he might be interested in exploring further. The computer, by comparing the aptitude-preference profile for the student with the 40 occupational profiles seeks those occupations for which no discrepancies exist. It lists those occupations for the student.

The system as described was tested in two separate trials in the Altoona, Pennsylvania School District. The first trial, approximately ten weeks in length, was held in the spring of 1967 at Keith Junior High School. The youngsters scheduled for the system experience were 72 ninth grade boys who had indicated that they were interested in selecting a vocational or technical course of study the following year at the senior high school.

The second field trial was conducted at Roosevelt Junior High School involving the scheduling of 140 ninth grade boys between October, 1967 and May 1968. These boys also were selected on the basis of their having indicated a preference for a vocational or technical course of study the following year.

On the basis of the Keith trial, several revisions were made on the system during the summer of 1967. Utilizing the revised system in the Roosevelt trial (N=140 boys), it was found that:

1. The average number of 40-minute sessions the boys scheduled was five.
2. Of the 40 occupational descriptions stored, the youngsters, on the average, chose 16 of them--eleven complete, and five partial.
3. Sixty-five per cent of the boys utilized the opportunity to request the computer to select occupations which they might have pursued further.
4. The boys generally felt that the terminal experience was interesting and valuable.
5. The boys felt that as a result of the experience they were considering more rather than fewer occupations.
6. The boys were generally stimulated to seek out additional occupational information on their own.
7. The typeouts were perceived to be the most helpful and most interesting component of the terminal configuration, the slides least helpful and least interesting.
8. Many of the boys missed the opportunity while in a terminal session to discuss problems which arose.
9. The discrepancy statements were useful in that they appeared to force a boy to examine himself.
10. The boys did not appear to develop any consistent strategy of exploration while working with the system.
11. As compared to a group of similar boys who were not scheduled on the system, the experimental groups stated occupational goals and choice of course of study did not seem to be affected by the experience.
12. Specific items of occupational information can be taught by using the CACE system.
13. The boys generally perceived the system as the best way to explore occupations, second only to on-the-job experience.

Based upon the results of the field trials at Keith and Roosevelt, it may be concluded that the computer-assisted career exploration system is an effective and feasible device in assisting youth to explore occupational opportunities. It also may be concluded that the lack of a sound theoretical foundation in vocational psychology impeded the investigators in drawing any implications of the study with regard to such factors as vocational maturity. It is thereby recommended that future efforts in this area be focused upon a theoretical as well as a problem orientation.

THE SUCCESSFUL PROMOTION OF ADULT VOCATIONAL EDUCATIONAL PROGRAMS

by Chester O. Mills

The subject of my talk today was given to me as somewhat of a surprise; as I expected the topic to be more complicated. Actually, it is quite simple since we must find the beginning place and procede with orderly deliberation. This may sound silly, but obviously when one is given a topic such as this he is bewildered as to where to begin and where to end. It takes a whole college academic term to discuss a few elements involved, and even then only guidelines may be depended upon in Adult Vocational Education programing. Each community is different--the inter-city, the suburbs, the small villages and towns, the rural areas, and so forth. All have such unique characteristics in that no definite pattern can be set to successfully promote and develop a local vocational adult education program. As in football, the coach says that a team performs best when it perfects its fundamentals. I believe that vocational adult education has certain fundamentals common to all communities, and this is where we should begin. Too many programs have been started without a proper plan, or from the so-called "hunch" approach, and without first reviewing the fundamentals and procedures which have proven to be successful. We have studied and we understand the characteristics of the adult learner, and this is one of the basic fundamentals, but remember, it is only one of the many facets unique to the basic intricacies in any vocational program at the adult level.

In my limited time, let me leave with you a few basic fundamentals which no doubt you are familar, but need reassurance that they are not out of style. The first, of course, is the adult student, and without him and his needs and differences we would have no adult programs in any sense. Taking a look at the adult student and placing him in a chart called The Inevitable Cycle, seen here in Chart Number 1, you will note that his needs and his preferences are based upon the community needs and effective training. You will note that community needs come from what industry, business and service industries require, and the needs in agriculture and other occupations. The student does not make these needs. He must conform to the requirements of that occupation which he is interested. You will also note that the arrows running from the adult student circle to the circle of community needs and back again, are significent. You will note there is only one arrow running both ways between community needs and the third area, the training required by the adult student.

The effective training, as indicated, requires a comprehensive program. It calls for full cooperation of the school and certainly the effective performance of the adult educator. This inevitable cycle gives an indication that the simpleness of the basic requirements of the adult student really are only affected by the two circles indicated, and any change, any additions, any implementation that takes place would be insignificant, although it may be necessary.

Chart Number 1

THE INEVITABLE CYCLE

The relationship between these two circles is only the beginning. One compliments the other, however, the effective training circle is the result of well-laid plans of the educator.

Successful promotion depends on many things, but the basic fundamentals are always present. Other elements will develop and implimentation must take place, therefore; let's look at some of the fundamentally successful promotion areas indicated in Chart Number 2. The Administrator heads the list because without him no program could exist, even though it may have students, it may have teachers, and it may have the other necessary components; but without someone to guide and direct the program it will not be successful. The community, business and industrial, agriculture, and others are included in the next area of importance; then comes the school community, the adult student, the committees of advisement, which are many and varied in their characteristics, having different responsibilities and knowledges necessary to make them effective. The administrator must know how to determine the areas of need. These are the skilled techniques involved, and he also must know these methods for using and serving this information. Such procedures might be accomplished many ways, too numerous to discuss at this time, however; the use of the media in all of its forms is the most important and is normally available.

Since the administrator is the key person in any successful program, he must be technically competent, professionally

Use of Media

competent, and enthusiastic about his work. Looking at Chart Number 3, The Effectiveness of the Vocational and Technical Education Administrator depends upon his knowledge of the community, knowledge of adult student psychology, and student counseling, knowledge of the broad scope of vocational and technical education, knowledge of the program planning, knowledge of budgeting, and I might add at this point, that budgeting does not necessarily mean that there is a common panacea for solving budgeting problems. The administrator must be able to determine costs then look at those sources readily available to him to make his program solvent.

The administrator must have a knowledge of evaluating techniques, which is a continuous process and a knowledge of promotional methods, much of which has been practiced many years ago but is still in vogue.

Homer Kempher listed his 13 ways of promoting a program and determining needs while with the U.S. Office of Education a number of years ago. He laid down these fundamental guidelines which stated that the administrator must have the knowledge of selecting and training adult education instructors as he knew the great majority of adult instructors would normally come from the work-a-day world and who lacked classroom techniques and the necessary methods to hold the attention and the interest of the adult student. He knew that some type of program, such as adult instructor training,

Chart Number 3

THE EFFECTIVENESS OF THE VOCATIONAL AND TECHNICAL EDUCATION ADMINISTRATOR

Depends upon his:

- Knowledge of Community
- Knowledge of Adult Student Psychology and Student Counseling
- Knowledge of the Broad Scope of Vocational and Technical Education
- Knowledge of Program Planning
- Knowledge of Budgeting
- Knowledge of Evaluating Techniques
- Knowledge of Promotional Methods
- Knowledge of Selecting and Training Adult Education Instructors
- Knowledge of the Effective Use of Advisory Groups
- Self Improvement

should be provided those adult instructors in order that they may perform a better job of imparting knowledges to his students. Further, the administrator must have the knowledge of the effective use of advisory groups, whether they be joint apprenticeship committees, craft committees, occupational committees, general advisory committees, or others; and in addition, and least but not least, he must be constantly solving problems unique to his own program.

Let us look at this individual, known as the instructor, as he may make or break a program. Chart Number 4 indicates that a successful adult vocational program always has as its cornerstone the adult instructor since he is occupationally competent, he is respected by those in his field, he is intellectually competent, he possesses the adult teaching skills, he understands the adult as a learner and he has an infectious personality. But to say these nice things about the adult instructor can only be done so when the administrators are able to recruit such a person, train them, and then know how to supervise them. Not only are they hard to find, they are hard to get, as we must look for them principally in business and industry and agriculture. Other sources of teachers may involve the various fields related to vocational home economics, the school, former teachers, college instructors and other near-by adult vocational programs. We must look for quality as these instructors are necessary for successful programs, since they have the personal contact with the student, who as we all know is a

Chart Number 4

THE ADULT INSTRUCTOR MAKES A PROGRAM SUCCESSFUL

Because

He Has an Infectious Personality

voluntary type of individual, and if he is not getting what he wants, when and how he wants it, he will get up and walk out. He has no more time to waste on those types of offerings.

Many vocational administrators have no thoughtful or systematic plan to organize courses or plan programs, whether they be long- or short-range. The course is the fundamental aspect of any program. It must be organized with precision. These courses may be an activity or academic in nature, but nevertheless, they require a specific procedure in organizing, so that they will be successful.

Looking at Chart Number 5 and beginning at the botton, you will note that here in step one of the many steps leading to a successful conduction of the adult vocational course is to establish supervision for any course; that is, who will visit it; who will make the final evaluation; who will determine whether the student is getting that what he needs; etc. This is what we mean by supervision.

The second step is determining training needs, and if you'll look briefly at Chart Number 6 you will note several aspects, or facets that must be considered by the administrator for identifying local needs. Your own advisory committee, use of interest finders, receiving individual requests, conferences with business leaders, conferences with labor organizations, use of business reports, conferences with trade associations, are some of the areas of determining needs. Conferences with other community educators, and

Successful Programs Built on Experience

And if you will look at Chart Number 7 you will find a few of the aspects for publicizing your program or courses such as using the services of the advisory and special committees, using the media in a timely way, and using those agencies whose members benefit from the program. Individual contact technique which might be over the telephone, by letters, flyers, posters, newsletters, etc., are proven the best publicizers, but if you will allow me to use this term, "former students," who will say, it helped me and I am sure it will help you.

The next step requires some form of report of application, as most vocational courses in the various states require some form of communication indicating that it is a vocational course and reimbursement is normally forthcoming. These items must be accomplished and sent to the proper authorities. The next step is to enroll the participants and then conduct the course, and of course, during the course, and after the course, an evaluation takes place; and this in itself takes a long time. Evaluation is quite precise and intricate, but we are only listing the fundamentals today.

Last, but not least, the necessary final reports that must be sent to the necessary authorities who require them; and there may be several. However, like any other type of business, reports and paper work are always required.

You cannot do all of this alone, you are not superhuman, you are not technically competent in all fields.

Chart Number 7

6. etc.

Former Students as Promoters

Therefore, you need help from people who know. Those people may be in advisory committees of one form or another. They may be business leaders, or they may come from various walks of life, and certainly they come from the occupations who are in need of personnel that meet their demands.

Great football coaches stress fundamentals. Let us trust the fundamentals in promoting a successful vocational adult education program. We can always implement, we can always improve, we can always utilize additional and more sophisticated methods as each situation arises, but we cannot use these methods unless we have the basic foundations in order to conduct the successful program. Follow these fundamentals and I am sure you will be on the right road.

Chester O. Mills
PhD

ADULT PROGRAM DESIGN AND RECRUITMENT IN AGRICULTURE

FOR DIFFERENT AGE LEVEL GROUPS

Presented at the American Vocational Education Conference, Dallas, Texas, Wednesday, December 11, 1968, by James E. Dougan, Director, Ohio Agricultural Education Service, State Department of Education, Columbus, Ohio.

Importance of Agriculture

The agricultural industry which furnishes our food and fiber is the largest and most basic industry we have in this country. On November 20, 1967, we passed the two hundred million population mark. It took 17 years to get the last 50 million and it is estimated it will take 12 years to get the next 50 million. The investment in farms is 240 billion dollars with cash receipts of 50 billion dollars each year. The agribusiness industry does a 250 billion dollar business each year. Stated another way, for every one dollar of agricultural products sold, we have an increase in our economy of approximately $5.00.

Adult Education in Agriculture

Today learning throughout life is as much a necessity as it is a prerogative in the future. Learning throughout life will be imperative.

Traditionally, adult education in agriculture is for persons who have completed or left full-time schooling and this type of education has been a vital part of our public school systems.

Over 40% of the persons served by Vocational Education in Agriculture are adults and considering the meager time, effort and money devoted to adult education, this percentage of the total number served is noteworthy.

With new programs emerging in agricultural education, broadened purposes, and new clientele, it is imperative that appropriate education programs be developed for all adults whose vocational or avocational interest involves knowledge and skills in agricultural subjects. I am sure that designing programs that will expand and improve adult education in agriculture will be dependent upon more adequate financing of these programs, more use of specialist, resource people, materials and adequate facilities.

Adult education programs in agriculture will continue as a part of the high school program and tremendous growth will take place in area vocational centers and post high school institutions. Designing programs for various age level groups should not only have as a major objective the imparting of specialized knowledge and skills but the developing of further interest in and ability for learning throughout life. We should strive to develop the abilities of adults to learn continually throughout life by themselves as well as through formal public school sponsored programs.

Additional Benefits Adult Education Programs Should Provide To All Age Level Groups

Adult education programs should not only impart technical knowledge and skills but should perform a function of developing the cultural aspects of the individual such as:

1. Expanding communication skills - These programs must assume the task of increasing the ability of the participants to communicate in many forms and by many means.
2. Develop flexibility - The ability and willingness of the individual to change in a technical and economic world is essential.
3. Improve human relations - Some of the most serious and difficult problems of adults in agriculture are in this area.
4. Facilitate participation - The involvement of the individual in the improvement of their communities and their schools, understanding of and participation in politics and effective participation in agricultural and civic organizations. The involvement of people is important in designing adult education programs for all people.
5. Expedite personal growth - Adult education programs in agriculture has rendered its best service to people who have well developed interests and who have sought out places where their curiosities and interests could be fulfilled.

Principles of Program Planning in Adult Education - In designing adult education programs for groups of different age levels, there are five simple principles that should be considered:

1. Determine the needs of the constituents.
2. Enlist their participation in the planning.
3. Determine clear and specific objectives.
4. Develop or design a program plan.
5. Plan and carry out a system of appraisal.

Guidelines for Designing Adult Education Programs for Different Age Level Groups

In Ohio, we have developed the following guidelines to assist in developing adult programs in agriculture for different age level groups:

1. Major emphasis in adult learning is placed on the practical rather than the academic, on the applied rather than theory and on skills rather than on knowledge or information.
2. Adults do not generally study vocational subjects on their own, therefore, they need direction and supervision where the learning is taking place, on-the-job instruction and supervision.
3. Adults from the lower echelon of the social class feel a certain reluctance to expose themselves to formal learning situations.
4. Younger and more knowledgeable persons are the ones most likely to consider the possibility of enrolling in adult education programs to satisfy their learning interests.
5. In a recent study of over 300 young and adult farmers enrolled in organized instruction, 70% said the reason they were enrolled was to upgrade themselves on new innovations in agriculture and to become a better informed person.

6. In a recent survey, three factors distinguish the participants in adult education from the non-participants.

   A. Age - nearly 4 out of 5 were under 50 and over 1/2 of the total group were under 40.

   B. Better educated: - There is a greater number enrolled who have graduated from high school than the non-participants.

   C. Employment - Approximately 95% were employed and 75% held full-time jobs in some phase of agriculture.

7. On-The-Farm Instruction - On-the-farm instruction and supervision must be a part of the adult program in production agriculture. Indications are that this is also true in programs to train and re-train individuals in non-production agriculture.

8. I am sure that as we design programs in the future for both young and adult farmers which are to be successful and have real meaning, we must concentrate our efforts on management strategies rather than the traditional farm management. This instruction must benefit the individual and in turn the community, as has been proved in Farm Management strategy programs. The benefit cost ratio for farm operators enrolled in the Minnesota Vocational Agriculture Farm Business Management adult education program is about 4 to 1. For every dollar invested by the farm operator in the business management program, either in actual cash expense or in hours of classroom and individual instruction, the enrollee received about $4.00 in increased labor and management income. It was also found that for every dollar expended in conducting such a program, the community can expect to generate $9.00 in increased business activity.

9. In Ohio, we have just completed a series of regional seminars for Presidents of local Young Farmer associations, inwhich 200 outstanding leaders in agriculture were in attendance. They were unanimous in

stating that the local vocational agriculture teachers should become the director of the total agricultural education program in the school district and that the young farmers would assume the responsibility for assisting the teacher in designing an educational program and would see that sufficient enrollment was obtained.

Separate Programs For Young and Adult Farmers

In Ohio, we are rather specific in our recommendation to local schools and Agricultural Education teachers in regard to designing separate educational programs for young and adult farmers. Our decision for recommending separate educational programs for these two groups has been based on the following:

1. The young farmer is more progressive and more eager in his quest for agricultural knowledge and skills.
2. Young farmers feel "free-er" to discuss their problems and concerns by themselves.
3. Older farmers dominate the discussions in a mixed group.
4. Separate programs for young and adult farmers enable the teacher to develop and conduct a series of meetings covering the specific areas requested by each group.
5. The young farmer may need discussions in areas where the adult farmer is already proficient. Example : Young farmers like to discuss fertilizer and the chemistry involved in soils. Adult farmers, on the other hand, are more interested in farm law, deeds, wills, and social security.
6. In the area of finance, young farmers particularly have different concerns.
7. Young farmers are more interested in farm mechanics and request laboratory experience in this area more readily. Many young farmers can completely service a tractor and other agricultural equipment.

8. The young farmer program needs to meet the social needs of this group. Adult farmers are often already members of many organizations. Young farmers may be just beginning to become active in community and social activities.
9. Separate classes provide a better opportunity to get the entire young farm family involved in agricultural tours, field days, etc.
10. Separate classes provide a better opportunity to more fully utilize the leadership abilities developed while they were FFA members.
11. Separate classes are an advantage often in a multiple teacher department because one teacher may be more competent with the younger group.
12. Separate classes provide a better opportunity for team teaching to be used effectively.

It is granted that combining the two groups will reduce teacher load, many of the young farmers can benefit from the experiences of the older farmers and that there are problems or concerns that are similar for both groups, but our findings have caused us to conclude that generally speaking, different educational programs should be developed for these two different age groups.

RECRUITMENT IN ADULT EDUCATION

Personal contact is the most used and most valued method of obtaining enrollment in adult programs. Study after study has shown that personal contact, letters, post cards, reviewing course outlines at the first meeting, and old members recruiting are methods most used and of the most value in obtaining attendance in adult education classes.

We have found that there seems to be some degree of success in recruiting enrollees by using mimeographed letters to individuals. This seems to have a degree of effectiveness with young adults and those that came from farms with a rather high capital outlay.

It is an established fact that the better the adult education program, the more successful the recruitment drive. The individual teacher is the vital factor in a successful recruitment campaign. By creating a stimulating and challenging environment in which adults can learn with dignity and enjoyment, the teacher is laying the ground work for future enrollment; because the adult, who senses an attitude of understanding, confidence, and respect on the part of the instructor is the best and most convincing public relations person for the program.

In a recent survey of adult classes in agriculture, we found that 70% of the enrollees had heard of the adult class from former students, but 22% had learned of the class by the way of posters in public businesses or newspaper announcements.

Teachers are good conversation pieces. When the adult students talk to friends or neighbors, they can either spread the good word about the friendly help the teacher has given them, or they can present a situation that will turn people away from the program. Another technique that has been used rather successfully is to arrange for a calling committee that will call individuals prior to the meeting informing them of the date, time, place, and the topic that will be discussed at the meeting. Recreational and social activities have proven to be valuable in retaining present enrollment particularly with younger adults. Other techniques that have been successful in retaining adult students are:

1. Treat students as adults and as peers. This can be done without dampening the student-teacher relationship.
2. Telephone students who are absent showing a genuine interest in their reason for missing the class session. Explain the importance of their regular attendance.
3. Send get-well cards to adult students when they are ill.
4. Review what happened in the previous class session at the beginning of each class period. This encourages absentees to return by easing their fear that they have fallen behind the rest of the class.

5. Stimulate the formation of friendship among the students. This develops a feeling of warmth and loyalty that brings them back.

6. At the end of each class session, give them a reason to return by telling them what is going to happen next time.

7. Whenever possible, give the adult students some pertinent material to take home to read or do. This would not be homework but a kind of fringe benefit.

8. Make sure that every class session gives each student a feeling of accomplishment. It is up to the teacher to diagnose each class members need. Then try to meet that need.

9. Classes for adults must show tangible evidence of providing the adult student with immediate rewards. Ideally, the adult student should get from each class session some knowledge or skill that he can put to practical use immediately.

10. Adults can teach others as they come to class with a background of knowledge which can often help the entire group.

11. As stated previously, a personal visit by the teacher to a prospective adult student is most effective. Adults enrolled in educational classes want and need on-the-job supervision and instruction.

TEACHER RECRUITMENT AND PROBLEMS RELATING TO SALARIES OF TEACHERS OF ADULT CLASSES

by
H. D. Bearden

Certain basic ingredients are necessary to provide the type and quality of instruction that must be offered to best serve the interest and needs of adults. The people who do the instructing are by far the most important of these ingredients and are in reality the keystone to a successful program. For this reason the planning and implementation of the many types and levels of adult education must include careful consideration of the competency of instructors needed to teach the various offerings. Failure to recruit capable instructors is no doubt a common cause of program ineffectiveness or failure.

It must be kept in mind, however, that the effectiveness of any instructors efforts is determined to a significant degree by the availability and support of other important items which may definitely influence the interest or willingness of capable individuals in accepting or not accepting a teaching assignment. Some of the most important of these essentials include:

> Suitable facilities for class meetings with appropriate equipment, tools, laboratory apparatus, teaching aids or whatever is needed for class activities.
>
> Carefully selected instructional content to meet the specific needs of the participants.
>
> Trainees who are interested in the instruction, who are aware of their needs and who are seeking help.
>
> Suitable class schedules with the allotment of sufficient time to effectively give the planned instruction.

These are basic ingredients for good, effective teaching - but will amount to little or nothing without the <u>heart</u> of the teaching process, <u>the instructor</u>.

It is true that a uniquely qualified instructor can teach with some degree of success even when confronted with serious handicaps - but a weak instructor may fail almost completely even when supported by all the other essentials for good teaching and learning.

If we accept the viewpoint that the instructor is really the heart of the program then we must agree that the selection of the right person for each teaching assignment is a most important aspect for program planning and administration.

The important task of recruiting teachers presents several major questions to which there are no clearly defined answers. For example:

*What kind of teachers do we need to teach adult classes? - What qualifications should we look for?
*How and where do we find such teachers?
*How selective can we be in recruiting teachers?
*Who is responsible for selecting teachers of adult classes?
*How important is the level of funding in teacher recruitment and program operation?
*What can we do with inexperienced teachers who have little knowledge of teaching responsibilities?

With the broad variation in the kinds and levels of instruction needed by adults it would be unwise and foolish to attempt to prescribe specific qualifications for the many kinds of teachers needed. This would be like prescribing a patented medicine as a cure for all ailments.

There are, however, certain fundamental qualifications that a teacher of adult classes should have if he is to function successfully.

1. He must have a mastery of the subject area, skills or activity he is to teach.

2. He must be able to make appropriate application of his instruction to the specific area of interest or needs of the participants.

3. He should be able to organize his instruction and present it in a simple and clear manner.

4. He must be able to play the role of a leader exercising tact and patience in developing maximum participation of class members.

5. He must have physical stamina to stand the strain of teaching in the evening after a full days work.

6. He must have pride in his regular employment field and a sincere interest in teaching others his knowledge and skills.

7. He must be able to use instructional techniques that have proven successful with adults including the use of appropriate teaching aids.

How and where do we find teachers with these basic qualifications? This has always been a problem but perhaps more difficult now than ever before because of the great demand and competition for people who have leadership ability and who can function well in a productive assignment.

An examination of adult education across the nation will reveal that a major portion of the teaching of adult classes is done by persons who are not trained professionally for this specialty. A typical adult education instructor is one who makes his living in some profession or occupation other than teaching. Part-time or evening school instructors are most common. Some are most sincere in wanting to teach to help others; some are drafted into the teaching assignment by the professional or occupational groups they represent; some agree to teach simply to make a little extra money. Sometimes the results are excellent but too often the results are inferior teaching for people who expect and deserve better.

Recruiting instructors is the responsibility of the local administrator. In many instances it can be a most difficult task to find available qualified people who are interested in teaching adult classes. Wise and aggressive administrators will look at every possible source for teachers, will use

every ethical means of contact, and will use the help of any individual or group who can be of assistance to find the best available prospects in his search for competent teachers. Less than maximum efforts in recruiting will often result in the selection of readily available persons who are probably the least qualified to teach.

The most effective assistance in locating and selecting instructors with the desired skill and technical qualifications can come from advisory committees representing the field in which the instruction is to be given. This is logical because the committee members are usually leaders or substantial representatives of the occupational field in which the training is to be offered and therefore know the type of instruction needed. They also know the best qualified people in the field who may be prospective instructors.

The help of business, industrial or trade groups such as associations and other occupational representatives should be solicited. Of course, the use of news media such as newspapers, radio and television may result in immediate contact with qualified people who are interested in instructing.

Other possible sources of teachers include (1) day school teachers, (2) college and private school teachers and (3) former teachers. It should be remembered, however, that just because these people are experienced in the profession of teaching does not necessarily qualify them to teach adult classes in specialized fields. The lack of application of instruction and the lack of understanding of the special techniques of teaching adults are common causes of their failure.

Some major industries retire certain personnel while they are still in their middle fifties. Many of these people have excellent skill and technical backgrounds and may be good prospective instructors. Persons leaving the Military Services may be well qualified in technical fields and may be interested in teaching.

In reality there resides in every locality well qualified people who could render the needed instructional services, if they were available, for most any group of adults. Unfortunately, these individuals are either too busy or they are not interested in taking on the additional responsibility of teaching.

There must be a strong incentive and we cannot overlook the fact that good pay for services rendered is one of the best incentives known in this country. Yes, the most significant factor in teacher recruitment in adult education is the level of program funding. With the exception of a few states, insufficient financing of local programs causes serious restrictions in securing the services of the best qualified teachers. It must be recognized that good, sound, effective teaching is not a small responsibility and therefore cannot be treated as a cheap commodity. People who are capable and can render excellent service should be paid and paid well. The most justified expenditure in program operation is the pay necessary to obtain good instructors. The local administrator should utilize all sources of funds available including higher level enrollment fees, if needed, to finance the necessary salaries to secure the services of the best instructors.

It is true that there are some highly qualified people in their particular fields of work who are willing to contribute time and efforts to teach adult groups and expect little or no pay for their services. These are rare individuals and substantial programs cannot be developed and carried forward on the basis of free or low cost instructor services.

A great percent of our instructors for adult groups in trade and industrial fields are people who hold jobs in the industrial or business community and teach part-time or in the evenings after work hours. A great many of these people have had no teaching experience or professional training for a teaching assignment. They agree to serve as an instructor in their occupational fields without realizing the extent of the responsibilities involved in a teaching assignment. Without professional assistance these inexperienced instructors, in due course of time, begin to realize they have accepted an assignment that requires them to contribute much more time and work than anticipated. Consequently, their enthusiasm, interest and efforts begin to decline and eventually result in poor preparation and poor teaching.

This situation is common in adult trade and industrial education and too often is allowed to develop into difficulties and problems to all concerned. The best solution to the problem is professional teacher training assistance. The greatest need for help of beginning teachers of adult classes concerns the use of available instruction materials, of teaching plans, the techniques of teaching adults, and how to use available visual and other teaching aids. If teacher training assistance can be given in these areas at an early date the person who has the necessary technical and skill qualifications has a good chance of becoming a successful instructor.

In summary, we must increase our efforts to expand adult education to serve the increasing needs of our productive population for continuing specialized and applied education. The expansion of the program will depend to a major degree upon the quality of services offered. To provide the kind of program needed the best available instructors must be recruited and sufficient financing must be available to pay them for their services. Continued and increased emphasis must be placed on instructor improvement activities through professional teacher training services. These are major essentials for future program development. Without them the future will be about the same as the past.

ADULT VOCATIONAL EDUCATION

Success Stories of Local Programs and Course Offerings[1]

Just what is "success" in Adult Vocational Education? The dictionary defines success as "the favorable or prosperous termination of attempts or endeavors." But the word "termination" is not valid in the field of education if the concepts of career progression and self-actualization are to be integral components of instructional programs. Continuing education is the nomenclature frequently used to designate adult programs and this term seems more indicative of ongoing success in vocational education.

The criterion of success in public school sponsorship of vocational programs for post-secondary students is frequently just a number designating how many students have completed a particular course with resultant job placement or successful advancement to a senior institution. More realistic, it seems to me, is the approach of State Departments of Vocational Education, many of which are involved in follow-up studies of students enrolled in programs. These studies take into account the use that is being made of knowledge and skills gained in any particular educational offering. Success is more individualized with such an approach, as is illustrated by the story of a student who was enrolled in a child development training program at Phoenix College. This young lady's education was interrupted when she left school to be married to her service man fiance. Follow-up procedures disclosed that she was with her husband at Norfolk, Virginia where she was managing a cooperative nursery school for families of service personnel living at the base. She is happily and successfully putting to use vocational training which would not have been termed successful under some evaluative procedures. Information concerning her employment was received from a letter accompanying the returned follow-up card which did not have a category to code what she was doing. Computerized

---

[1]Presented by Lois Farone, Chairman, Home Economics Department, Phoenix College, Phoenix, Arizona.

methods of identifying success tend to be impersonal and lacking in ability to identify individual accomplishments which may be making a real contribution to society as well as providing personal satisfaction.

As individual teachers, coordinators or administrators, most of us are sadly remiss in determining and making known the many successes that are happening in vocational education, both adult and secondary. Standards of success need to be realistic, individualized and in line with program objectives. I am reminded of Dr. Mildred Weigle Wood, beloved mentor of Vocational Home Economics in Arizona and throughout the United States, who used to say, "A successful sewing project is a garment a student will wear and a successful cooking project is food that a student will eat." The satisfaction and feeling of success of the individual student is the ingredient which will produce continuing programs that fill both occupational and personal living needs.

A recent AVA Journal editorial stated that vocational education has a built-in evaluation mechanism because the product of the program is the youth or adult who gets a job and/or is able to progress to a higher level of employment. It further states that most teachers are aware of the success of their programs through placement and follow-up activities but reports of these successes rarely reach state, regional, or national level. While these statements are generally true, such methods of evaluation depersonalize the field of vocational education almost completely and more humanistic evaluative procedures need to be found. That the use of follow-up studies is frequently neglected in post-secondary programs was pointed out by research investigations made by Laure H. Sharp in 1966 which disclosed a serious gap in follow-up information in adult education.

When a search was made for success stories, many typical ones were uncovered. The Chicago Tribune under a Washington D.C. byline published an article recently which cited the increase of women trained under the vocational act from 2.1 million in 1963 to 3.8 million in 1967. Similar statistics for men would be even more spectacular. One of the factors giving impetus to adult vocational education has been the tremendous increase in junior colleges with semi-professional curricula and vocational-technical course offerings. California has been the pacemaker for the nation in community college development with 82 junior colleges now in operation in 67 districts. A variety of technical programs are included in their offerings as well as adult education for home and family life and pre-professional training, all of which are considered part of vocational education. Perhaps the explanation should be made for persons not familiar with the discipline of home economics that the vocation of homemaking was brought under the vocational umbrella as long ago as 1917 when federal reimbursement for vocational education was inaugrated under the Smith-Hughes Act. Phoenix, Arizona has had adult education for the vocation of homemaking for about forty years, originally under sponsorship of the secondary school system, now as part of the Maricopa County Junior College District community service offerings. Literally thousands of parents have learned to cope more effectively with problems of child-rearing, the dual role of homemaker and wage-earner, consumer problems and other areas related to successful family living.

The state of Ohio has many adult vocational education classes sponsored and financed jointly by local school systems and the State Department of Education. Through the Division of Vocational Education, training is offered to out-of-school youth and adults in the fields of agriculture, business and office, distributive,

home economics, and trade and industrial education. A project that has received nationwide attention is a pilot program initiated in Cleveland, Ohio to help itself. The Home Economics section of the AVA national convention held in Cleveland in 1967 was given a vivid and moving description of the progress of the program at that stage. A report issued in March, 1968 points up both program and individual successes in the four Metropolitan Housing projects where centers have been established to provide assistance in home and family living problems as well as basic education.[1] In each of the centers classes were initiated according to expressed interests and needs. However, human "connectors", residents of the areas, were used to make personal contacts and extend face-to-face invitations which were needed to encourage people to participate. All offerings were geared to the functional level of the student and an organized effort was made to take home economics education to where families live who need help in coping with complex problems of family life. It was found that when the bond of trust had been developed, residents would begin to enroll in formal classes. Four teachers and twenty part-time assistants personally contacted 4,000 of the 9720 residents in the first four months of the program. This project is moving successfully toward alleviating some of the inbred and self-perpetuating problems related to poverty which must first be met if culturally-deprived individuals and families are to become productive and happy community members.

A recent publication from the Division of Vocational-Technical Education in Tennessee tells the success stories of fifteen persons who received vocational training as adults in programs offered throughout the state.[2] Typical of the

[1] Cole, Sonia N. Helping the Disadvantaged Family Help Itself-One Ohio Project. Columbus, Ohio, March 1968.

[2] Dunn, Charles M. Vocational-Technical Education Brings Success to These Tennesseans. Murfreesboro, Tennessee. 1968.

stories told in this publication is that of a twenty-six year old young woman in Fayetteville, Tennessee. A school dropout at fourteen, married and divorced with five children to care for by age twenty-six, this young woman was faced with the prospect of living on welfare to provide for her family. She desired something better for her children than continuing to live on welfare so availed herself of the opportunity to take a practical nurse training program offered by a local hospital in conjunction with the Tennessee Department of Vocational-Technical Education. The first obstacle to overcome was lack of a high school diploma. After successfully completing the GED examination, she became a very good student in the nursing program even though competing with others with a far better educational background than her own. She has completed her training program, at the same time caring for her family of five.children and has a position in the surgical department of the house as scrub nurse. An intangible effect of her success story is the chance she is giving her children to develop values which will enable them to avoid the problems of her own early life. Occupational education for employment has directly affected six people's lives for the better in this situation and has provided a much-needed, well-trained, dedicated practical nurse for the hospital.

May I briefly describe several programs in the state of Arizona which may be similar to those conducted in your own states but which are illustrative of rather unique offerings in Arizona. In 1965, a one-year pilot program was implemented in a housing development in Phoenix cosponsored by the State Department of Vocational Education, the State Department of Welfare and the Home Economics Department of Phoenix College. This program had dual objectives: to train home management leaders from the inner city area who could work with individual homes in an effort to improve family living practices and to train child care aides to work in day care homes or centers. Thirteen home management advisors were trained and several

of them are still working with both individual families and with groups throughout the state to improve family life and to help prepare women (and men) to train for employment outside the home. One of the child care aides, a young woman, divorced and with a young child to support as well as her aged parents to care for, has continued to pursue an education and is presently working as an aide, with considerable responsibility on the job, for the Phoenix College Day Care and Nursery School Center.

A program to train family health assistants, offered through Arizona State University, with the support of the State Department of Vocational Education, has provided a large number of trained persons who can work effectively with families in times of crisis. More than three hundred persons have been trained to date in this program. A continuing aspect of the program has been the use of five persons, three negro and two of Spanish origin, as teacher aides in a WIN (Work Incentive Program) program recently started in the Phoenix area. The home economics aspect of the WIN program emphasizes preparation for employability and teaches such things as budgeting, planning and organization and pre-preparation so that the mother feels secure in leaving her family for outside employment. Homemakers in the WIN program are encouraged to let their children help them with household responsibilities and to set realistic goals for themselves and their families. Ways of improving personal appearance and understanding of the world of work are included in the training from which trainees may move directly into a job or into basic education or skill training depending on their abilities. They are given two years to complete training under this program; thus far, 150 trainees have moved through the initial phase of training and a total of twelve to fifteen hundred are expected to go through the program.

A Personal and Occupational Improvement Program is being provided for patients on conditional release from the Arizona State Hospital (our mental health facility). This program has dual objectives: to help patients improve their ability to function in their environment and to be able to interrelate with others; to acquaint patients with various job opportunities in different areas of entry-level jobs. These patients are living in approved sheltered homes and are a diverse group, men and women, young adults through late middle-aged. Although no tangible results of this program are yet documented, guidelines have been developed for more effective training for former mental patients and for next-step activities related to this initial program.

The Arizona Republic gives this account of a personal success story: So much failure is inevitable in programs designed to help the disadvantaged, sometimes the successes are lost in gloom. Case in point: Mrs. Prudence Winrow, 53, Negro, formal education eighth grade, and by profession, cleaning woman. With the last of her own five children approaching maturity, the younger ones working their way through college, Mrs. Winrow was induced to enroll in the Manpower Training and Development program at the Skill Center in Phoenix. This program is administered by the Maricopa County Junior College District. First, Mrs, Winrow had to bone up on high-school-level subjects, in order to pass the high school equivalency test. She breezed through, with above-average score, thanks perhaps to the long hours she had spent helping her own children with homework. Between January and June of this year, Mrs. Winrow learned typing, filing, and operation of several systems of duplicating and calculating machines. June was a bad month for employment, what with the summer slump and vacationing student competition. But with the Manpower Development and Training staff seeking out leads, Mrs. Winrow

in September landed a job with the Valley National Bank, as file clerk in the trust department. This month she was promoted on merit, to stockroom clerk. She has her own desk complete with nameplate, her own typewriter, and a position of responsibility as keeper of the stockroom key. The President of the bank had better stay alert. A new employee is upward bound.

Time does not allow even mention of the many programs throughout the United States which are successfully training persons, with the help of Vocational Education, to live and work more effectively in our complex, continually changing society. All levels of occupational endeavor from the teacher aide to the electronics technician or fashion merchandising supervisor are included in the spectrum of adult vocational education. Success is not unusual but communication of ideas and outcomes is sadly lacking. Perhaps what is needed is an internal ERIC network to serve as a clearing house for all the busy teachers and administrators in vocational education. "Nothing succeeds like success" - let's hear about it.

*AMERICAN VOCATIONAL ASSOCIATION CONVENTION, DALLAS, TEXAS, DECEMBER 9-13, 1968

Two research studies are reported in these papers presented at the Research Committee meeting of the National Association of Industrial and Technical Teacher Educators. "Effects of Field and Job-Oriented Technical Retraining on Manpower Utilization of the Unemployed" by David C. Bjorkquist summarizes a comparison of two Manpower Development and Training Act technical education programs which involved eight measures of job related behavior in a longitudinal design covering 50 weeks of training and a 2-year followup span. No differences between groups of graduates were found for "level of responsibility," "amount of unemployment," and "additional education." Job-oriented graduates tended to be more satisfied with their work. "Social class identification" was highest for both groups at the time of graduation. Field-oriented graduates had a higher mean starting salary. The second study, "A Comparison of Selected Contemporary Programs in Industrial Education" by Leslie H. Cochran, reviews a dissertation which sought to develop a method for analyzing contemporary programs. Six contemporary secondary industrial education programs were selected and analyzed using the analysis instrument. This instrument covers objectives, content, and teaching methods. Results of the selected analysis are presented. (EM)

Two years ago at the American Vocational Association Convention in Denver, we presented an interim report on the research project entitled, "Effects of Field and Job-Oriented Technical Retraining on Manpower Utilization of the Unemployed." That report focused on the selection of students, the training programs and initial placement of graduates. The purpose of this presentation is to present data gathered through interviews during the first two years following training. After briefly relating the characteristics of the training programs and the students, and the initial placement of graduates, I will describe the variables used in evaluations, our findings, and the conclusions which we have drawn.

The purpose of this study was to compare a specific job-oriented program with a broad field-oriented program for the preparation of technicians in the field of mechanical technology. Both programs were operated under the Manpower Development and Training Act and were approximately 50 weeks long.

The Training Programs

The job-oriented program was intended to prepare tool designers and was operated by the School District of the City of Allentown, Pennsylvania. Through the use of an industrial advisory committee, subject matter was selected which was considered to be essential for the preparation of a tool designer. Much of the effort of the program administrators was spent in the integration of this subject matter to develop a meaningful total.

The field-oriented program was in machine and tool design technology, and was developed to prepare individuals for a variety of positions in the field of mechanical technology. This program was planned and operated by the Department of Continuing Education in Engineering of The Pennsylvania State University. Courses were included in the curriculum which would develop a broad basic knowledge of mechanical technology. This program was taught on a two-year campus of the University where students shared facilities with approximately 800 full-time students in baccalaureate and associate degree programs.

About one-half of each of the programs of instruction was devoted to drawing and design. The two programs were quite similar also in the amounts of mathematics, applied physics, communications, and production problems which were offered. The job-oriented program did include 230 hours of instruction in machine shop processes.

Though similar in course titles and hours of instruction, the two curriculums were different in that their objective was different. As suggested earlier, the job oriented program focused on the development of skills and knowledges necessary for on-the-job performance in tool designing. In the field-

oriented program emphasis was placed on the success of individuals in each of the courses offered so that application might be made to several occupations within the field of mechanical technology.

The Students

Students were selected from throughout Pennsylvania according to criteria developed by the training institutions. After determining each applicant's eligibility for training under MDTA. Selection of students was based on graduation from high school or equivalency, familiarity with mechanics or machine operation, expressed desire to be retrained as a technician, and satisfactory aptitudes as measured by the General Aptitude Test Battery. The aspirations of the applicants were confirmed through a series of interviews conducted by the Pennsylvania State Employment Service and the research staff.

The 35 students assigned to the job-oriented program and the 40 students assigned to the field-oriented program were similar in aptitudes, amount of previous education, and age. The work histories of 21 field-oriented and eight job-oriented students did not include mechanical or machine operator experience.

Of the 35 entrants into the job-oriented program, 32 were graduated; 25 of 40 field-oriented students were graduated. Twelve of the 15 who were dropped from the field-oriented program had failed a mathematics or a mathematics based course such as mechanics or strength materials.

Initial Placement

Six months after the completion of training 28 job-oriented and 19 field-oriented graduates were employed in industry. Others were in the military service or school while one from each program was unemployed.

The mean starting salary of field-oriented graduates was $110.00 a week and $96.81 for job-oriented graduates. Percentage wise, the field-oriented graduates were twice as mobile as were the job-oriented graduates. Relative to beginning weekly salaries, there was a significant interaction between the training programs and mobility. Mobile field-oriented graduates were earning more than mobile job-oriented graduates and immobile job-oriented graduates were earning more than immobile field-oriented graduates. Although many went to work immediately after training, it required an average of almost four weeks for graduates of the two programs to begin their first industrial jobs.

The Continuing Job

Data relative to the behavior of graduates in their jobs were gathered in the evaluation of the training programs. These data were gathered through personel interviews conducted one and two years after completion of training at the employment location of the graduate. The outputs of the job-oriented and the field-oriented training programs were compared on the basis of eight variables. These were: the level of job responsibility, unemployment, mobility, salary, job satisfaction, employer rating, social class identification, and additional training taken.

In determining the job responsibilities of graduates, a job analysis was used to gather data about the work field, skills used on the job, job functions, and level of involvement with data, people, and things. The analysis technique was structured by the United States Bureau of Employment Security and used in their preparation of the 1965 edition of the Dictionary of Occupational Titles.

Two years after the completion of training, 24 job-oriented and 15 field-oriented graduates were employed in the work fields of drafting and engineering. Other industrially employed graduates were employed in researching, appraising, administering, and machining.

All of the graduates of both programs were using many of the work skills which were specifically taught in the training programs. This was evidenced by the use of drafting, design, and mathematics, and by their job functions. Three-fourths or more of the graduates of both programs were using freehand lettering, sketching, orthographic drawing, sectioning, dimensioning, and scale drawing skills. One-half or more of the job-oriented graduates were designing tools, layouts and templates. The same was true of field-oriented graduates in designing fixtures, jigs, tools, layouts and gauges. Most frequently used mathematical skills were arithmetic, algebra, right triangle trigonometry, and plane geometry.

By observing the output of the worker and asking questions about what he did, how and why he did it, and what skill was involved, the job analyst prepared a job description. A sentence analysis of each job description was prepared to identify the worker's function relative to data, people, and things.

The jobs of the 24 job-oriented and 15 field-oriented graduates employed in drafting or engineering one year after training required copying, computing, compiling, or analyzing data. Twenty-seven of the 39 graduates in drafting or engineering were compiling data. Two years after graduation the level of data involvement had increased for six job-oriented and two field-oriented graduates while decreasing for one graduate of each program.

Seventeen job-oriented and ten field-oriented graduates were not required by their jobs to have a significant involvement with people. Between one and two years after graduation the level of involvement with people had increased for seven graduates and decreased for one.

All graduates of both programs in the work fields of drafting and engineering were precision working with things one and two years after completing training.

There were no significant differences in the level of involvement with data, people, or things between graduates of the two training programs.

During the first year following graduation, there were 16 job-oriented and nine field-oriented graduates who reported that they had been unemployed. These periods of unemployment were as long as 26 weeks for one job-oriented graduate and 21 weeks for one field-oriented graduate. During the second year after training, two job-oriented graduates were unemployed an average of two weeks each. During this same period, four field-oriented graduates were unemployed an average of five and one-half weeks each. The longest period of unemployment for any individual during the second year was nine weeks.

There was a significant relationship between the time required by graduates to secure their first jobs and the mobility of those graduates. It required an average of .81 weeks for mobile graduates and 5.53 weeks for immobile graduates to begin work after training. Twelve job-oriented graduates made a total of 13 moves during the first year after graduation. Twenty moves were made by 13 field-oriented graduates in that same time. Three job-oriented and four field-oriented graduates made one move each during the second year.

Mean weekly starting salaries for field-oriented graduates were $13.19 higher than they were for job-oriented graduates. After two years there was a weekly average difference of $13.18 in favor of the field-oriented group. Two years after graduation average weekly salaries were $120.02 for job-oriented graduates and $133.20 for field-oriented graduates. These average salaries tended to be somewhat lower than salaries for Class B Draftsmen, as reported in Occupational Wage Surveys.

Five aspects of the satisfaction of graduates with their jobs were measured using the Job Description Index. The satisfaction of graduates with the supervision, promotion, work, pay, and people aspects of their jobs were measured. Although there was no significant fluctuation in job satisfaction scores during the first two years after training, scores tended to be slightly higher on the first measure six months after graduation. Job-oriented graduates were

significantly better satisfied with the work aspect of their jobs than were field-oriented graduates six months and one year after the completion of training. After two years on the job, there was no difference between groups in their job satisfaction.

Supervisors rated the on-the-job performance of graduates one year and two years after graduation. More than one-half of the graduates of both programs were rated above average or outstanding during each rating on manipulative work, personal and social qualities, and work qualities and habits. In occupational technology, graduates of both programs tended to be rated average or above average with the exception of ratings for the field-oriented group on manipulative work. There were larger percentages of graduates rated above average or outstanding after two years on the job than there were the year previous. These upward shifts were accompanied by decreasing percentages of average ratings.

With an abrupt change in occupation, as provided for through retraining, and the relationship of occupation to socio-economic status, it was hypothesized that there would be a change in the social class identification of students. A social class identification scale was administered before training, immediately after training, and two years after graduation. There was a significant increase in social class identification of both training groups between pretesting and post-testing and scores two years after graduation. In other words, the peak social class identification scores occured at the conclusion of training.

During the two year period following training, 12 job-oriented and 12 field-oriented graduates were involved in additional formal education. Two field-oriented graduates were full-time college students while the other 22 were industrially employed and studying on a part-time basis. This additional education included part-time college attendance, company sponsored educational conferences, and formal classes conducted at the place of employment.

Conclusions

This study was an evaluation of two technical education programs for the retraining of underemployed and unemployed workers under the Manpower Development and Training Act. Eight measures of the job related behaviors of former students were used to evaluate the effect of training on individuals with differing personal characteristics. Some of these findings were interesting because there were differences while others were interesting because there was no difference between groups.

There was no difference in the level of responsibility held by graduates of the two programs. It was suggested by advocates of field-oriented technical education that preparation in a broad array of basic subject matter would allow graduates of this program to advance further and to find employment in more occupations. Neither of these things happened. Although the field-oriented program served as more of a screening device by dropping more students, it did not produce graduates who operated at higher levels of involvement with data, people, or things. Perhaps 50 weeks did not allow for adequate field-oriented preparation, or maybe two years on the job did not allow those graduates to find their proper level of responsibility. However, as time goes on the effects of training will probably diminish while the effect of intervening variables will increase.

There were no differences in the amount of unemployment experienced by the training groups as measured by weeks to secure first job or in annual average weeks of unemployment.

When the length of time required to secure first job was compared on the basis of mobility, there was a dramatic difference. Mobile graduates required an average of less than one week to secure their first jobs while immobile graduates required five and one-half weeks. Mobile graduates also appeared to earn more money, but this was confounded by the interaction of the effect of training program. If, as these findings suggest, mobility does make persons more employable, the challenge to educators is to increase the mobility of their graduates.

From first employment through the first two years, field-oriented graduates consistently earned more than job-oriented graduates. As suggested earlier, the effect of training program and the effect of mobility interacted. The graduates of the field-oriented program had higher average weekly salaries, but they were also more mobile.

In most aspects of their work, there was no difference in the satisfaction which graduates of the two training programs derived from their jobs. Job-oriented graduates tended to be better satisfied with the work their jobs included than were field-oriented graduates. This difference was significant six months and one year after graduation. It was earlier speculated that as the level of responsibility rose for field-oriented graduates, their level of satisfaction with their work would increase. However, there had not been a sufficient increase in the level of responsibility for those graduates during their first two years on the job to determine if this was true.

After spending a considerable amount of time in gathering supervisor ratings, it became apparent that these ratings would not be useful in comparing training programs. The

ratings were interesting and give some general notion of the acceptability of the graduates, but their reliability is highly suspect. This was largely because an absolute scale was not provided for ratings and each supervisor rated his employee according to some personal reference.

It was anticipated that social class identification scores would increase over the period of training, but it was not expected that they would drop again after two years on the job. This may not be entirely unlike the attitudes of teachers which are most idealistic just before graduation and tend to be less so after some time at work. Perhaps the design technology graduates entered their jobs with an idealized impression of their status, but revised their personal estimates after two years of facing the realities of their work.

There was no difference between training groups in the number of graduates who pursued additional education. This dimension seemed important because of the emphasis on additional education for advancement in technical occupations. Unfortunately, no college credit was given for the course work completed during the initial training programs, and some graduates found that they had to repeat some course work to advance to a higher level. The earning of an associate or bachelors degree was strongly encouraged in some industrial organizations.

One of the more disturbing aspects of this project was the success of several students who did not fully qualify according to the criteria for selection. It is not disturbing that they succeeded, but it is disturbing to know that there probably were prospective students who were not considered for training because of their credentials who could have succeeded in training.

This project demonstrated that individuals could be selected from the ranks of the underemployed and unemployed and be prepared as technicians within one year. Their acceptability in industry was shown by their rate of employment and the level of their job responsibilities. With selected groups of students preparing in occupational fields with high demands for workers, shortening of the training period should be considered. This would be particularily desirable when students are taken from the labor force for training. This training may not prepare them for employment for the rest of their lives, but it should give them the opportunity for employment in occupations in which they may grow and prepare for change.

A COMPARISON OF SELECTED CONTEMPORARY PROGRAMS IN INDUSTRIAL EDUCATION

A Review of a Doctoral Dissertation

A COMPARISON OF SELECTED CONTEMPORARY PROGRAMS IN INDUSTRIAL EDUCATION

An Abstract by:

Leslie H. Cochran
Department of Industrial Education
Wayne State University

One of the problems that has long plagued industrial educators is their lack of common understanding of what is being promoted in the field. As a result, many plans have been developed with little concern for preceding or existing attempts in curriculum development. Those studies that have focused on the problem have been primarily evaluative in character, and provide only a limited basis for comparison.

And yet, each time an innovative plan or new program is introduced several common questions come to the forefront. For example, how does the plan fit into the total educational program? Is it really new or is it only a new title to disguise old practices? How is it different from the old practices? Or, what implications will it have for students and staff? These and other questions cannot be answered by evaluating a particular plan, but need to be considered by comparing various programs on a uniform framework.

Statement of the Problem

In this respect, it was the purpose of this study to compare and analyze selected contemporary programs in industrial education in an attempt to determine the common elements, basic directions, and their significance to the field. More specifically, the study focused upon three major objectives: (1) To review historically industrial education programs on the secondary level to illustrate the position and character of current plans; (2) to develop a conceptual framework for industrial education that could be used to analyze any of the contemporary programs in the field; and (3) to apply the framework to the selected programs that meet the pre-established criteria for an analysis of each.

Methodology for the Study

To attain the stated objectives it was necessary to develop a systematic operational plan. This called for a historical review, an identification and selection of programs to be studied, the development of an instrument to compare the selected programs, and methods for collecting, analyzing, and interpreting the data.

Historical Review

A review was made of library bulletins, periodicals, and references to historically trace the development of industrial education programs at the secondary school level. This overview focused primarily on approaches, movements, and programs prior to 1960 in an attempt to provide a historical perspective for the study and to suggest basic relationships between current curriculum plans.

Identification and Selection of Programs

Two major sources were utilized to identify the secondary school programs to be studied. This involved, first of all, a continuation of the review of literature. Secondly, a paper by Marcus V. McWaters titled a "Survey and Brief Descriptive Analysis of Curricular Innovations for Secondary School" that was presented at the Fifty-Fourth Mississippi Valley Industrial Arts Conference, November 9, 1967 was reviewed.

Thirty-five programs were identified. Following a request for further descriptive materials, the programs were compared with the pre-established selection criteria which included five factors:

(1) That the program had been developed and implemented since 1960.

(2) That the home base (sponsoring university or public school system) was located within Region V, U. S. Office of Education (which includes Indiana, Illinois, Michigan, Ohio, and Wisconsin).

(3) That the program was under study and evaluation in an industrial teacher education program.

(4) That the program was at the experimentation and testing stage in the secondary schools.

(5) That the descriptive material concerning the program was available either in the form of articles or official releases.

The programs selected included the American Industry Project, Functions of Industry, Galaxy Plan, Industrial Arts Curriculum Project, Industriology Project, Orchestrated Systems Approach, and the Partnership Vocational Education Project.

Development of the Instrument

Prior to the formal construction of an instrument to compare the selected programs, an extensive review was made of related research, textbooks, and articles in the fields of curriculum and industrial education. The data collected in this review provided a basis for this research, and suggested the rationale for a systematic study of the programs in industrial education.

Based on the findings of this review, a 119-item check-list was developed. This tentative instrument was presented to members of the doctoral committee and a committee of judges. Through a series of individual conferences with the judges and doctoral committee members, these items were reduced to fifty. In structuring this sample every effort was made to maintain the representativeness of the original items. Attention was focused on the elimination of duplication, improved clarity, and concisement. A certain amount of homogeneity in the sample was stressed so that no item could be picked out because of extraneous or incidental grounds. As the appraisal and refinement continued, concern was expressed by the judges over the lack of specificity in the instrument.

Based upon the suggestion to make the instrument more specific, consideration was given to the Q-technique. The Q-Sort method was adapted to provide a forced-choice procedure for the study. In this way each participant could use his own frame of reference to characterize a particular situation by arranging the predetermined statements in their order of importance.

As a result, the fifty statements were place on individual cards, refined again by the judges, and sent out on a pilot basis to three programs that had not met all of the selection criteria. Based upon the responses of the participants to the pilot instrument, minor revisions and improvements were made.

Data Collection and Interpretation

Three basic procedures were utilized to obtain descriptive material to compare to seven selected programs. (1) An initial request was sent to each of the leaders associated with the programs to secure articles, and other materials describing their program. (2) The fifty statements, in Q-Sort form, were sent to each of the participants. (3) Upon the return of each of the initial instruments, a follow-up interview was scheduled with each of the leaders.

The data collected and reported were interpreted in two distinct forms. This involved a brief overview of each of the programs on the basis of the interview and other descriptive materials. Secondly, the cards received from each of the selected programs were sorted according to the prearranged frequency distribution.

Selected Findings

The findings in this study can be grouped under three major sections: (1) historical, (2) program descriptions, and (3) program comparisons. The first two of these headings provided rationale for, and a description of many of the programs reviewed in the study. For the purposes of this report, however, focus was directed on the specific comparison made between the seven selected programs. The data summarized in Tables 1, 2, and 3 project the positions taken by the representative of each program in respect to the fifty statements. In this respect, a statement ranked in column A would represent the highest degree of support, while those dispersed in columns B through G would represent descending degrees of support.

TABLE 1

RANKING OF STATEMENTS PERTAINING TO OBJECTIVES ACCORDING TO PROGRAM CODINGS[a]

Statements	Rating Cards						
	A	B	C	D	E	F	G
5) The program is based on selected experiences that provide for an understanding and appreciation of industry and its workers.		1,2 & 5	3 & 7	6	4		
8) The program is directed toward the development of specific salable technical and manipulative skills designed to aid the student in entering employment at the completion of the program.			3	4	6	1,5 & 7	2
11) The students develop ability to select, purchase, and use wisely the products of industry.			1 & 3	4,6 & 7	2 & 5		
15) The program provides for both male and female students.		1,3 & 5		2,4 6 & 7			
20) Activities in the courses are directed toward outcomes for avocational interests and hobbies in the crafts.					4 & 7	3 & 5	1,2 & 6
25) The program studies life needs as created by or related to industry.	4	5	1 & 6	3 & 7	2		
28) The program promotes occupational guidance by helping the student assess his occupational potential, interests, and capabilities.	2	1,3 &4	6	5	7		

TABLE 1--(Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
37) A student is allowed to choose an area of concentration according to his interests and abilities.	3		2 & 6	1,4 & 7	5		
40) Consideration is focused on the development of an appreciation for good design and craftmanship.				1,3 4,5 6 & 7	2		
46) The program is directed toward providing exploratory experiences in selected industrial type activities.	2	4	1,5 6 & 7	3			
47) The development of desirable work and safe habits are integrated into the courses of study.		3	1,4 & 6	2 & 7	5		
49) The program is designed to provide the student with basic technical skills and occupational guidance information on a pre-vocational basis.		2		3,4 5 & 6	1 & 7		

[a]The rating of each of the programs is reported according to the following code: 1--American Industry Project, 2--Functions of Industry, 3--Galaxy Plan, 4--Industrial Arts Curriculum Project, 5--Industriology Project, 6--Orchestrated Systems Approach, and 7--Partnership Vocational Education Project.

TABLE 2

RANKING OF STATEMENTS PERTAINING TO CONTENT ACCORDING TO PROGRAM CODINGS[b]

Statements	Rating Cards						
	A	B	C	D	E	F	G
1) Content is organized so that the major emphasis is placed on manipulative type activities (operational rather than informational).				4,5 & 6	3	7	1 & 2
2) The content in industrial education courses is closely correlated with subject matter taught in other departments in the areas of science, mathematics, and English.	7			1	2,5 & 6	3 & 4	
3) The program provides for experiences in research and development as they are utilized in the manufacturing industries.		2 & 6	1 & 7	3,4 & 5			
4) The program provides occupational information about job requirements, working conditions, salaries, and how to get a job.		4	2,3 & 5		1 & 6	7	
6) The content is predetermined by the teacher alone with problems selected that relate to the needs of students and the community.				1,2 & 4	7	3,5 & 6	
10) The program provides for practical applications of scientific principles.		7	1,3 4 & 6	2 & 5			

TABLE 2--(Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
17) The program provides for instruction in the use of common hand and machine tools used in industry.			3 & 4	1,2 & 6	5 & 7		
21) Curriculum content is derived through an analysis of job positions in an occupational cluster as identified by the Dictionary of Occupational Titles.			2		3 & 4	1,5 6 & 7	
22) Content is primarily concerned with informational topics (technical, guidance, and general) rather than manipulative type activities.				4 & 7		1,2 3,5 & 6	
26) The content is determined through a team approach involving the teacher and an advisory committee representing management and labor.		3		1,2 & 4	6 & 7		5
29) The program focuses on a study and the use of industrial materials and processes.			5	3,4 6 & 7	1	2	
30) Industry is studied by concentrating on the production of goods and the servicing of products.	2 & 6	7	5	3	1 & 4		
31) The program considers industry in its totality, including labor, capital, and distribution.	1 & 5	2,4 & 7		3 & 6			

TABLE 2 -- (Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
32) The program is based on a wide variety of selected experiences that sample several industries.	5	6	2 & 7	1,3 & 4			
39) The program provides experiences with selected basic manufacturing processes.		2	5	1,3 6 & 7	4		
41) Content is identified through an instructional analysis of major industrial activities or trades such as welding (trade) or activities in industrial arts (plastics).	3		5		2 & 6	1	4 & 7
42) The dominant technologies such as mechanical, chemical, and electrical are the basic source for content.				3,5 & 7	2 & 6	1 & 4	
44) Content is classified under such instructional areas as woodworking, metalworking, and drafting.					3 & 5	2 & 7	1,4 & 6
45) A study of industry is made by concentrating on the construction and manufacturing industries.	4			6 & 7	1,2 3 & 5		
48) Industry is studied through an in-depth concentration on one industry.				2 & 5	1,6 & 7	3 & 4	
50) Content is identified from an analysis of selected industrial payroll jobs.			2	3	5	1 & 6	4 & 7

[b]The rating of each of the programs is reported according to the following code: 1--American Industry Project, 2--Functions of Industry, 3--Galaxy Plan, 4--Industrial Arts Curriculum Project, 5--Industriology Project, 6--Orchestrated Systems Approach, and 7--Partnership Vocational Education Project.

TABLE 3

RANKING OF STATEMENTS PERTAINING TO TEACHING METHODS ACCORDING TO PROGRAM CODINGS[c]

Statements	Rating Cards						
	A	B	C	D	E	F	G
7) Application of the content is made in two or more laboratories within the department. For example, drawings needed for the development of a product are completed in a drafting room prior to construction in another laboratory.		5	7	1 & 2	4 & 6		3
9) Students make use of research principles and techniques as they undertake projects, experiments, or reports.		1 & 7	2,4 5 & 6			3	
12) Students are grouped for class activities according to standardized test scores, including intelligence quotient, and verbal and quantitative scores.			4		1	2,3 & 7	5 & 6
13) Multiple "tracks" are built-in to the program to accommodate individual differences in ability and interest.		3	4 & 6	2,5 & 7	1		
14) Focus is placed on individualized instruction through programed instruction or individual progression at a work station.			7	1 & 6	3 & 4	2 & 5	
16) The class organization and major activities are managed and directed by students with the teacher remaining in the background.		6	3	1,2 5 & 7		4	

TABLE 3 --(Continued)

	A	B	C	D	E	F	G
18) Students develop desired outcomes through experimentation with, and testing of, industrial materials.		7	1 & 3	2,5 & 6	4		
19) Instruction is oriented around problem solving experiences.		1,4 6 & 7		3 & 5	2		
23) A team of science and industrial education teachers is used to correlate content taught in the two fields.	7				1,2 3 & 6	4	5
24) Activities included in the courses are jointly planned by the student and teacher.			5 & 6	1,2 & 7	3	4	
27) Provision for individual ability differences is made through a multi-activity organization.		5 & 6	1,2 3,4 & 7				
33) The program encourages students to work and plan together as a team.	6	3	1,4 5 & 7	2			
34) Emphasis is placed in the various units on the use of instructional sheets (assignment, operation, and information).				1 & 5	3,4 & 7	2 & 6	
35) Role playing is advocated as a method to more accurately interpret industry.		1,2 & 6	4		3,5 & 7		

TABLE 3 --(Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
36) Instruction is focused largely on units to be studied by the entire class at one time.			2	1,4 & 5		3 & 6	7
38) Instruction is focused on basic generalizations (concepts) covering an understanding of industry.	1,4 & 7	5		2,3 & 6			
43) The student progresses from a general understanding of industry (or a system) to specific units (or components).	1,3 5 & 6	4	2 & 7				

[c]The rating of each of the programs is reported according to the following code: 1--American Industry Project, 2--Functions of Industry, 3--Galaxy Plan, 4--Industrial Arts Curriculum Project, 5--Industriology Project, 6--Orchestrated Systems Approach, and 7--Partnership Vocational Education Project.

Interpretation of the Findings

Based on the historical review of early industrial education programs, the descriptive overview of on-going programs, and the systematic comparison of selected programs found in this study, numerous conclusions could be made. It is not the purpose of this research, however, to make a prolific listing of these. Instead, four major conclusions have been identified which warrant the attention of the profession.

Conclusions

(1) The field of industrial education has been in a constant state of flux and reorientation since its early inception in the secondary schools. In the period since 1960, however, more modifications with wider implications have been produced than in any of the preceding decades during the twentieth century.

(2) There are identifiable curriculum elements in the field of industrial education that can be incorporated into a conceptual framework to systematically compare contemporary industrial education programs.

(3) There is general agreement between individual leaders associated with the selected programs under study on at least fifty percent of the items in the conceptual framework. Although this agreement is evident, it must be remembered, however, that the structure of these programs may vary greatly since different positions may be taken on key issues.

(4) There is general agreement among all of the selected programs, as demonstrated by the identified leaders, on specified items in the conceptual framework. In general these similarities may be stated as follows:

> (a) A lesser degree of emphasis is placed on manipulative type activities, while the emphasis on the application of scientific principles through experiences in research and development has been increased.
>
> (b) Provision for individual differences is made through multi-activity organization so the student can progress from a general understanding of industry to more specific tasks.
>
> (c) The classification of instructional content under such areas as "woodworking" and "metalworking," and the focus on activities directed toward avocational interests and the crafts are de-emphasized.

(d) A "middle-of-the-road" position is evidenced in regards to the emphasis placed on good design and craftsmanship, the use of common hand and machine tools, and consumer knowledges as related to the selection, purchasing, and wise use of industrial products.

Observations

In conducting this research several observations were made in regard to this study. Although these are not directly or conclusively supported by the findings, there was sufficient support to warrant their inclusion.

(1) The selected programs under study revealed an increased amount of emphasis on the interpretation of industry as one of the dominant objectives for industrial education. The basis for this shift was because of the increased complexity of the technological society, and the need for greater occupational information to properly understand and interpret the role of industry.

(2) In general, the selected programs represent a reaction to the conventional industrial education programs of preceding decades. This general trend, represented by the programs under study, is illustrated by the standard terms, such as "metal-working," "instructional sheets," and even "industrial arts" which are in various degrees of disrepute. Concern is also evidenced in respect to basic experiences and craft-oriented activities included in conventional programs.

(3) Each of the programs present a structure that reveals particular strengths, but none of the programs is ready for final evaluation since they are in the development and implementation stages.

(4) The similarities and differences between the programs suggest the need for further attempts in curriculum development. Each of these illustrate the need for continual development and refinement to project future industrial education programs.

(5) The thirty-five identified programs concerned with innovative approaches reviewed in this study suggest the dissatisfaction of the profession with on-going industrial education programs in secondary schools. There is a genuine searching for the direction and role of industrial education in the total educational program.

Address of Senator Wayne Morse (D.-Ore.)

American Vocational Association

Dallas, Texas, December 10, 1968

EDUCATION FOR JOBS IN A TECHNOLOGICAL SOCIETY

Last year the administration sent to Congress its 1968 vocational education legislative proposals, under the title of: "The Partnership For Learning and Earning Act."

Thanks in large part to the contributions of Lowell Burkett and the American Vocational Association, the Congress did not pass that law but rather, after nearly two years of hearings, we developed and passed a much broader and much more important one -- The Vocational Education Amendments of 1968.

I think, however, the concept of an educational "partnership" is a good one to dwell upon for a moment. It was the partnership of business and education which gave vocational education its first national mandate with the Smith-Hughes Act of 1917. It was a kind of partnership between the American Vocational Association and the Congress which developed the two principal vocational enactments of this decade, in 1963 and 1968. And it will be the continued

partnership of business, industry, vocational educators and government which will be needed to translate the 1968 Amendments into action which is educationally relevant to our times. Our educational programs must be brought more into line with the needs created by the modern Twentieth Century America.

If America is to survive as a free democracy in this new, technological society in which we live, we must thoroughly re-examine our educational philosophy. We must overhaul our educational system and design programs which are calculated to prepare our citizens -- and particularly our youngsters -- for life in a world of work which demands skilled workers.

"Education for education's sake" is a luxury which, unfortunately, only the twenty percent of our population which completes college can even dream of, let alone enjoy. For the remaining four out of five of us, public education must be made more meaningful, more practical, more job-oriented.

I believe that public education should be the <u>means</u>, and not an end in itself. The real job of education is to prepare people for life in our technological society; and that means, for most of us, preparing people for living in the "world of work."

The finest education system in the world -- which is ours -- is the source of very little pride to the five out of every ten college students who don't graduate; to the 900,000 annual high school

drop-outs; to the one million high school graduates who enter the labor force every June without a marketable skill and who are consigned to the laborer's unemployment lines; to the millions of under-employed youths and adults who do have unskilled, underpaid jobs, but who are the last to be hired, the first to be fired, and who never quite earn a living wage.

The Age of Technology is here. It's coming signifies a great new era of prosperity and, perhaps, unheard of leisure and luxury for many. But it also has tolled the death knell for the unskilled workers. Our general education high school diploma is no longer an adequate preparation for the skills which business and industry are looking for. It is no longer a ticket to success.

We do not lack for jobs in America. In any newspaper we find jobs aplenty for skilled workers. But we desperately lack adequately trained and educated people to fill those jobs.

Today the Federal Government is spending nearly $300 million to train youngsters through the Job Corps program. The Poverty Program expends another $400 million on training programs for adults. And we spend almost an identical sum to train and retrain more than a quarter of a million others through our regular manpower training programs.

These programs are essential and must be continued and expanded -- at least for the present. They are designed to remedy the past and current failures of our educational systems; and remedial programs are always more expensive than doing the job right the first time. But our long-range goal must be to render these expensive manpower and poverty crash programs largely unnecessary.

Ours has become the Technological Society and our problem is, how do we educate our children to take advantage of our vast, new knowledge -- how can we protect and promote the individual freedom and opportunity of every citizen to benefit from this new technology -- to share to the fullest the fruits and blessings of our society. And, how can we combat one of the bitterest fruits of our new technological society -- the alienation of our citizens: the frustration that comes from civil rights won but full opportunity still not enjoyed; the crime of job opportunities going begging for lack of skills; the desperation of poor jobs and no jobs amidst good jobs aplenty.

During the period of the Johnson-Humphrey Administration, we have put more laws on the books to strengthen the educational opportunities of our young people than all prior periods combined. But five years of progress cannot overcome fifty years of false complacency; nor can it be expected wholly to keep pace with technological advances.

I look forward to a re-ordering of our educational priorities so that the majority will have the same options to pursue

meaningful, relevant courses of instruction leading to job opportunities which our relatively few, college-bound students now enjoy. We need a new educational policy for our technological society--an "action" policy which will make us put into practice all that we know and can learn about educating people for useful and rewarding lives.

The Vocational Education Amendments of 1968 go a long way toward such a re-ordering; and they nave the potential for providing such an "action" policy and program.

Perhaps the most important single implication of this legislation stems from its comprehensiveness. As you know, it directs Federal funds to a wide variety of services and programs at every level of education. This says, in effect, that vocational education must now be considered by the education community at large to be one of the major missions of the public schools.

Certainly, this law addresses itself to the task of encouraging fundamental changes in educational philosophy. For example, cooperative education programs, when properly implemented, will utilize concepts of direct experience--perhaps the best method yet devised for learning. John Dewey, once noted that, "The development within the young of attitudes and dispositions necessary to the continuous and progressive life of a society cannot take place by direct conveyance of beliefs, emotions and knowledge. It takes place through the intermediary of the environment."

The application of Public Law 90-576 can bring relevance to the entire process of education. Through its exemplary and innovative programs, for instance, which may begin at the elementary level, students can begin to relate "academic work" to real life situations. Reading, writing and arithmetic can be taught in the context of

occupational preparation or orientation. In many cases, vocational ducation will be the factor which motivates learning.

By this process, schools and teachers can help students to integrate the practical and the theoretical--a result which well may increase the school's ability to hold the potential drop-out. To broaden the scope of vocational education, school personnel must learn to work together to find new approaches for providing experiences that will expand the occupational aspirations of youth and give them a basis for making occupational choices

Another major implication of this new act lies in its provision for citizen participation in establishing goals and priorities for our schools, and in the utilization of public and private resources and the community to prepare students for employment. For example, through broadly representative advisory councils--state and national--itizen participation is assured in the decision-making processes.

The instructional program is geared to efficient employment standards, and employers will be called upon to participate both in establishing the curriculum and in providing on-the-job training. Here, of course, it is the emphasis rather than the practice which is new. But now there will be public bodies of citizens who will measure how well our schools perform their mission of occupational preparation.

The act also calls for the participation of private training resources and for the use of resources of industry and other employers in making opportunities accessible to all. If we are to bridge the gap between education and earning a decent and dignified living, if we are to build more bridges between education and business, we must create a more viable industry-education partnership. Obviously government and school systems cannot do the job alone. We must make the maximum possible use of all the most appropriate, economical and

effective community resources. And this new law requires that we do so.

We will be hearing a lot more about involving industry in job training. And, clearly, industry can and does play a role in training people for work "on the job". It must do more.

But we can no longer afford to lose the advantage of a public school system which has custody of virtually every school-age child. We must move toward the ideal that the public schools will do the job right the first time, thus avoiding the painful and expensive process of crash retraining projects.

In addition to providing in-service training of its own employees, and working with the schools in cooperative, part-time vocational education programs, industry must press its rights as the employer-consumer of the educational product: namely, the student. It must participate in advisory councils. It must help in the development of new curricula. It must explore released-time programs both for employees to return, part-time for further continuing education, and for supervisory personnel and skilled workers to share their skills with students as part-time teachers.

All of the initiatives, opportunities, and challenges are contemplated by the Vocational Education Amendments of 1968, and more.

I see this legislation as a challenge, perhaps the best challenge, to the viability of the public school system as we know it. Time is running out, and perhaps should run out, for a system which consistently fails one-half of the college population and, in addition, many millions of high school students. The public cannot much longer permit such a system to attempt to shift the blame for inadequate results to the students alone.

If our nation could not endure, one hundred years ago, half slave and half free, it cannot now long survive with only half of our citizens free to benefit but with half ill-prepared to survive economically in our technological society.

Every newspaper we read today bears witness that we have, in our society, an open wound of ignorance stemming from poor preparation for today's life. If we do not apply the healing powers of education to that lesion, the infection will spread and contaminate our entire body politic.

We in the Congress have enacted many public laws in the educational area. President Johnson signed P. L. 90-576 as the sixtieth of his tenure. I think each is needed and I am proud of my role in their enactment. But it will be you and your colleagues in education who must make our new systems work. As a legislator I salute you. As a parent and grandfather I pray for your success in learning quickly and effectively to meet the needs of our children. Given the quality of your dedication as citizen-statesmen I have no fear for the future. I know that you will go through those doors which have been opened by the new legislation confident that through your strengthened efforts your students can build in America that "green and pleasant land" that is our ideal for the 21st Century.

[1]Presented by Mr. Archie G. Breslin, Assistant Director for Secondary Vocational Education, State of Washington.

ROLE OF THE VOCATIONAL EDUCATION ADMINISTRATOR IN DEVELOPING SUCCESSFUL PATTERNS OF ORGANIZATION

Any consideration of successful organizational patterns for vocational education administration should take into account at the start the nature of the program. Vocational education is probably the most sensitive part of the total program of public education insofar as community reaction is concerned, but more significantly insofar as being able to react quickly and effectively to the individual needs for vocational training as well as the business and industry needs for skilled manpower. It follows, then, that there are certain fundamentals that should be taken into account.

Any organizational structure should be so designed as to make possible this kind of an effective relationship between a community and the vocational education program. The administrative head of the vocational program on the local level must be in a position to be able to make commitments on the spot as they have to do with the establishment of classes, development of instructional materials, employment of teachers, and other similar matters. Without such authority to respond, the effectiveness of the vocational program, both in terms of its service to people as well as its economic contribution, is severely restricted. Often times, however, vocational educators insist that the director of a vocational education program in a local situation must be answerable directly to the superintendent and must be given equivalent title and salary status with other assistant superintendents who also report direct. This tends to become a controversial request and more often than not is interpreted by the general education establishment as being a bureaucratic attempt on the part of the vocational man to take over. It would seem to be a more prudent position to seek authority with responsibility and not bid for precise job title. This is to say that if an individual is going to have the responsibility generally inherent in the vocational program, then to be effective he must likewise have the authority to go with it. Equal pay for equal work is laudable, but is a separate issue.

Basic to this consideration is the assumption that vocational education is an integral part of the total program of public education. If we believe that it is, then thought must be given to conducting ourselves in all respects as a member of the total team and not give the image of being "the man who came to dinner". The significance and complexity of this becomes even more critical on the state level. In situations where the total public education responsibility from K - 14 rests with one single State Board of Education, then it would appear that the same basic fundamentals of administrative organization that have appropriateness in the local school district would likewise apply on the state level. However, when this K - 14 responsibility is fragmented amongst two or three separate boards, then life becomes exceedingly complicated.

Experiences we are currently having in the State of Washington are most interesting. It is likewise most curious that in most of the discussions having to do with who is in charge of what and how should fragmented board responsibilities be coordinated, what makes for the best educational experience for the youth and adult hardly ever gets into the conversation.

Is it possible that we could start with the focus on the client, so to speak, and begin by asking ourselves what is the best kind of educational program from the students' point of view. It would seem that certainly one of the ingredients that one would have to consider would be a high degree of articulation throughout the entire educational program. This is to say, in terms of vocational education, there should be reflections at least in the kindergarten that would be related to in-depth preparatory programs in the 14th grade, let's say. How does one accomplish this when the responsibility for this educational range is divided amongst three agencies?

In the over-all I would submit that the proper role of the vocational education responsibility is to insure that people who have need for this kind of instruction should be able to have it available, and that it should be bona fide, efficient, and effective. In a multiple

board situation on the state level, assuming that vocational education is a part of the total range of education experience K - 14, then it would seem that the vocational education responsibility is largely a support role to the other two boards. In the event there is a separate system of state vocational schools operated directly by the State Board for Vocational Education, then we have a situation that is less complicated and perhaps it is principally a philosophical question as to whether it is good to so separate or in the long look to conduct vocational education as a part of the total comprehensive public education effort.

Vocational education as we look to the future must, it seems to me, make a basic decision. Are we a part of the total program of public education? If we are, then I think we must give more thought to how we can work effectively as an integral part of that system rather than completely retreat to a position of splendid isolation. There are those who would immediately say, "Well, there is much history to point out that this kind of an attempt has never been successful and that all that would result would be a watered-down vocational education program." This has occurred in times past and probably will be a problem again in the future. I am wondering, however, if it is always the case that the general education establishment is the villain of the peace, or if it isn't quite possible that vocational education practitioners could work more intelligently and more nearly as a full blood brother of the total team.

Prepared by Ernest G. Kramer, Director of Vocational Education, Washington State, for delivery at the American Vocational Association Convention, December 11, 1968, Dallas, Texas

(In the absence of Mr. Kramer, this presentation will be made by Mr. Archie G. Breslin, Assistant Director ~~of~~ for Secondary Vocational Education, State of Washington)

PATTERNS AND PRINCIPLES OF ORGANIZATION

FOR

VOCATIONAL EDUCATION

Byrl R. Shoemaker
Director of Vocational Education
State Department of Education
Columbus, Ohio

PATTERNS AND PRINCIPLES OF ORGANIZATION FOR VOCATIONAL EDUCATION

Vocational Education

The issue today is not "shall we hold on to the comprehensive high school" but "how can we provide a comprehensive educational program". There are very few "comprehensive" high schools in our nation. Outside of our large cities very few school districts as they are now constituted in most of our States can offer a comprehensive program in vocational education. Studies would indicate that a minimum of 500 students should be enrolled in vocational education programs in order to provide for even a minimum scope of offerings. Experiences in Ohio would indicate that the enrollment of 500 students in vocational education at the eleventh and twelfth grade level would require an enrollment of 1500 students in the upper two grades of the school or schools participating in the vocational programs. Likewise, to meet a desirable program enrollment of 1300 students in a two-year program would require an enrollment of 4,000 students in the upper two grades of the high school. A vocational program is dependent upon its breadth in order to reach the different interests and ability levels of the students. The opportunity to provide this breadth is based upon:

1. The availability of sufficient tax base to support the necessary construction, equipment, and operation.

2. A sufficient student base to provide an economical enrollment in the individual programs offered.

Experiences in Ohio have indicated that area centers can be established to serve a number of school districts with the area centers serving as an extension of each of the participating schools. Under this plan, students in the last two years of their public school experience may enroll in the vocational center on a full-time basis, but continue their registry and official relationship with the local school district. The students are officially members of the school districts participating in the area centers and may play athletics and participate in extra curricular activities. Students graduate from the local school district, rather than from the area vocational school. A pattern of taxation provides for the funding of local tax levies and bond issues in the same manner as they are voted by other school districts, even though the area school district is superimposed over that of the participating school districts. On the basis of the broad tax base gained by the joining together of a number of districts, the tax rate for construction and operation normally will run someplace between two to three mills on the total tax.

Experience within Ohio would indicate that joint vocational school districts can include an area measured in time of travel of thirty to forty minutes from the farthest home school to the area vocational center. Experience has indicated that joint vocational school districts can provide many services to the participating districts. In addition to that of vocational education programs for out-of-school youth and adults, in some cases, they serve as a center for post-high school technical education. The area vocational school becomes a center for not only high school youth, but also for retraining of unemployed out-of-school youth and adults, and upgrading instruction for employed workers.

In sections of many States, it is impossible to bring together sufficient students from the high school level to provide even a minimum comprehensiveness in the field

of vocational education. In these cases, the travel distances make daily commuting an impossibility. There is no evidence or experience which indicates that mobile units can do more than orient students to occupational areas. Mobile units can neither provide the type of equipment or the breadth of equipment necessary to prepare for adequate entrance into a vocation. Likewise, the amount of time a mobile unit would be available to a school would not give the opportunity to develop any depth of skill or technical knowledge. In areas of such sparse population, consideration must be given to residential centers at either the high school or post-high school level.

Large cities of 200,000 population or over normally can offer a comprehensive vocational program without joining with other school districts. Some organizational patterns for vocational education in the larger cities and their strengths and limitations are as follows:

I. A series of vocational high schools, with broad programs corresponding to the needs of the students, with the district high schools providing limited vocational education programs, such as distributive education.

The areas of vocational education included in each district high school would need to be limited to those areas in which the possibilities for employment are adequate within the city or region for the number that would be prepared. In both the vocational high school and in the district high schools, the vocational programs would be limited to the eleventh and twelfth years, or the last two years of a student's school career.

A. Strengths
   1. Provides administration by people highly qualified to direct vocational education activities.
   2. Provides economy of equipment and facilities.
   3. Recognizes vocational education programs as an important field of education not to be delegated to secondary citizenship.
   4. Provides direct relationships with business and industry.
   5. Serves the needs of out-of-school youth and adults, as well as the needs of high school youth on an economical and effective basis for day, late afternoon, evening, or night programs, since vocational education areas are concentrated.
   6. Develops a necessary emotional state of belonging to, a pride in, and a satisfaction of participating in extra curricular activities within the vocational high school.

B. Possible Limitations
   1. Affects the entrance into certain colleges for a few students due to the lack of certain college preparatory offerings in the curriculum such as foreign languages.
   2. In vocational high schools, separates students planning to enter employment upon graduation from those planning to enter college upon graduation.
   3. In general high schools, enrolls qualified youth in proportion to the understanding that administrators have of vocational education and to the encouragement of qualified youth to attend.

Item three is a limitation only when administration of the school system does not understand the place of vocational education in the total program, and, therefore,

has not provided the necessary administrative relationships and in-service teacher education so that professional personnel will encourage students to enroll in vocational high schools on the basis of goals, interests, and abilities.

II. Vocational education service centers offering vocational programs and enrolling students from a number of district high schools in the eleventh and twelfth years, or the last two years of a student's school career.

Under such an arrangement, each of the district high schools would offer areas in vocational education as described in "I". Under this organizational pattern, schools could be organized either on a pattern such as 6-4-2 or pupils could be encouraged to enroll in the vocational education service center at the beginning of the eleventh year on the basis of needs and interests. Under this arrangement, the students could either become members of the vocational education service center or remain members of the district high school for purposes of extra curricular activities, sports, and graduation.

A. Strengths

1. Provides more effective use of expensive equipment and facilities than the vocational high school, because the facilities and equipment are used only by students enrolled in the vocational program and not by pre-vocational students in the ninth and tenth grades of a vocational high school.
2. Provides possibility for students participating in such vocational education service centers to take the required academic subjects at the vocational service center or in their district high school.
3. Provides administration by people highly qualified to direct vocational education activities.
4. Provides direct relationships with business and industry.
5. Serves the needs of out-of-school youth and adults, as well as the needs of high school youth for day, late afternoon, and evening programs on an economical and effective basis, since vocational education areas are concentrated.

B. Possible Limitations

1. Enrolls qualified youth in proportion to the understanding administrators and teachers have of vocational education and to the encouragement of qualified youth to attend. (This can be minimized through proper guidance and counseling and administration and teacher attitudes as evidenced by enrollments in joint vocational school districts.)
2. Limits extra curricular activities, since pupils change schools in the middle of their high school career, except for those who return to their district high schools.
3. Separates students enrolled in vocational education service centers from those completing their college preparatory programs in the district high schools.
4. Affects the entrance into certain colleges for a few students due to a lack of certain college preparatory offerings in the curriculum, such as foreign languages.

III. A vocational education service center combined with one of the district schools of the school system.

Under this organizational pattern, a vocational education service center, such as that identified in "II" above, would be attached to a district high school which would be offering the usual high school program including college preparatory, etc. Under this organizational pattern, students from other district high schools would attend the service center for vocational education purposes, and would remain attached to their own district high school.

A. Strengths

1. Provides effective use of expensive equipment and facilities.
2. Provides possibility for students participating in such vocational education service centers to take the required academic subjects at the vocational service center or in their district high school.
3. Provides administration by people highly qualified to direct vocational education activities.
4. Provides direct relationships with business and industry.
5. Serves the needs of out-of-school youth and adults as well as the needs of high school youth for day, late afternoon and evening programs on an economical and effective basis, since vocational education areas are concentrated.
6. Maintains relationships of vocational education students with students in college preparatory programs.

B. Possible Limitations

1. Leaves students from the district high schools other than those to which the service center is attached virtually in an "enemy camp" as concerns sports, extra curricular activities, loyalties, etc., unless they transfer to the district high school.
2. Affects the organization and operation of the vocational education programs by the more restrictive scheduling practices of the district high school programs.
3. Provides an atmosphere for the operation of the law of social gravity in which emphasis tends to flow toward the highest level of academic training, so that the vocational education programs become secondary citizenship.

IV. <u>Offer some vocational programs in each district high school, with enrollment of students into these high schools on a full-time basis determined by interests, goals, and abilities.</u>

Under this organizational pattern, students would enroll in their district high schools, and at the eleventh year they would be encouraged to transfer to and become a member of a district high school in keeping with their interests, goals, and abilities.

A. Strengths

1. Maintains relationships of vocational education students with students in college preparatory programs.
2. Develops loyalties and relationships within the one high school.
3. Enables the school district to show on an overall basis a rather comprehensive vocational education offering.

B. Limitations

1. Requires transporting students at times across town to a different district high school to enter an area of instruction of their choice.

2. Serves inefficiently the needs of out-of-school youth and adults for preparatory vocational and technical education, retraining for the unemployed, related instruction for apprentices, and up-grading instruction for adults.
3. Diverts attention from administration of vocational education programs, because the school is concerned predominately with academic facets of the school program.
4. Restricts flexibility for vocational education curriculum, due to the many scheduling problems within a district high school.
5. Leaves students from the district high schools other than those to which the vocational program is attached virtually in an "enemy camp" as concerns sports, extra curricular activities, loyalties, etc.
6. Restricts in a sense the offerings in vocational education programs to those offerings within the school district because of the likelihood that students would attend their own district high school.
7. Transfers pupils so frequently that they fail to establish loyalties, a necessary emotional state of belonging to or the satisfaction of identifying themselves with any school.

V. <u>Offer some vocational education programs in each district high school with students enrolling in their school district and attending another district for vocational education, but remaining a member of their own district high school.</u>

Under this organizational pattern, students would enroll in their district high school, and at the eleventh year would be encouraged to attend for vocational education purposes only, the district high school which offers the area of vocational education in which they are interested. The students would remain members of their district high school for purposes of sports, graduation, and extra curricular activities.

A. Strengths
1. Maintains relationships of vocational students with students in the college preparatory program.
2. Provides an economical comprehensive vocational education program, looking at the city as a whole.

B. Possible Limitations
1. Serves inefficiently the needs of out-of-school youth and adults for preparatory vocational and technical education, apprentices, and upgrading instruction for adults.
2. Requires transporting students at times across town to different district high schools to enroll in the area of instruction of their choice.
3. Diverts attention from administration of vocational education programs because the school is concerned predominately with academic facets of the school program.
4. Restricts in a sense the offerings in vocational education programs to those offerings within the school district, because of the likelihood that students would attend their own district high school.
5. Restricts flexibility for the vocational curriculum, due to the many scheduling problems within a district high school.
6. Requires students from one district high school to be divided among several other high schools in terms of their educational goals.

7. Requires student enrollment in district high schools in which pupils have no loyalties and are not a part of the extra curricular activities.
8. Leaves students from the district high schools other than those to which the vocational program is attached virtually in an "enemy camp" as concerns sports, extra curricular activities, loyalties, etc.
9. Provides an atmosphere for the operation of the law of social gravity in which emphasis tends to flow toward the highest level of academic training, so that the vocational education programs would become secondary citizenship.

In considering any organizational pattern, the following principles should be considered:

1. The organizational pattern should provide for a comprehensive program of vocational education.
2. The pattern of organization should not force students to enroll in an "enemy camp", (i.e. a rival "comprehensive" school which they play in competitive athletics).
3. The pattern of organization should not establish impossible transportation systems.
4. The pattern of organization must have the support of administrators, guidance counselors and parents, and the acceptance by the teacher group.
5. The pattern of organization must provide for administration of the vocational programs by persons competent in the field of vocational education.
6. The pattern or organization must provide for freedom of scheduling essential in the area of vocational education without the straight-jacket of the normal high school subject-centered curriculum.
7. The pattern of organization must be such as to provide for services to out-of-school youth and adults on a broad basis.

Technical Education

The most common organizational pattern for technical education and some of their strengths and limitations are described as follows:

I. A technical education center functioning in cooperation with an area vocational education center, both administered by one authority with one tax base for both.

Under this arrangement the local taxing authority is normally required to pay a portion of the building costs and operating costs. Such programs normally receive reimbursement from State and Federal agencies through the State Board of Education and/or a State Board of Higher Education. The technical institute programs in such joint ventures should be permitted to grant the associate degree for those programs meeting the standards of the State operating units.

A. Possible Strengths
   1. One tax base and taxing authority for both the area vocational and technical education programs.
   2. One board of education to administer the two programs.
   3. Possible savings in administrative costs for direction and supervision.

4. Possible savings in costs of materials and supplies.
5. Dual use of certain expensive laboratory facilities and of certain common service centers, such as heating, cafeteria, laboratories, etc.
6. A service center providing a continuing education in non-baccalaureate degree education, starting with vocational education at the high school level, and with provisions for vocational and technical education of a preparatory and upgrading nature on the post-high school level.
7. One relationship with industry for programs in which their advice and counsel must be sought on a continuing basis.
8. Technical education becomes a premium program in this organizational pattern, since it is the unit of highest status.
9. Emphasis in technical education in this organizational pattern tends to remain focused on its purpose of preparing youth for entrance into technical employment rather than upon continuation toward a baccalaureate degree.
10. There is less chance for the programs to become inclined toward a duplication of the first two years of a baccalaureate degree program.
11. The administration of the program will be in the hands of people concerned with vocational and technical education rather than baccalaureate degree education.
12. The local control inherent in this organizational pattern will encourage adjustment of the programs to meet the needs of both people and business and industry.
13. Local funds assist with both the construction and operation of the program.
14. Technical education is placed within a reasonable driving distance of the homes of the students.
15. Due to local and State participation in the construction and operation, the cost of technical education to the student is maintained at a reasonable rate.

B. Possible Limitations

1. The State Board of Regents is reluctant to approve the granting of the associate degree to any educational agency except those operating under the control of an institution of higher learning or operating under the direct administrative supervision of the State Board of Regents.
2. Under this arrangement technical education must be sold to students on the basis of the merits of a technical education program without the stimulation that occurs when students believe they are enrolling in a baccalaureate degree program.
3. Students from such programs will not automatically acquire baccalaureate degree credit, but, must have their credits evaluated by an institution of higher learning if they decide to go on to a baccalaureate degree program.
4. The present organizational pattern at the State level involving the State Board of Education and the State Board of Regents presents a problem of relationships when cooperative efforts of this type are established.

II. Technical Institutes

Separate technical institutes can be organized to provide for post-high school technical education. Under this plan, technical institutes become separate administrative units normally with the taxing authority separate from

any other educational unit in a city, county, or counties covered by the technical institute district. Such technical institutes may be assisted financially and supervised by either a State Board of Education or a Board of Higher Education within a State.

A. Possible Strengths
   1. The purpose of the institute is clearly in the area of post-high school technical education.
   2. Under this plan there would be a single administrative organization.
   3. The technical education program is the premium program in the institute, since it is the only program.
   4. The administration of the program would be concerned primarily with technical education.
   5. Relationships can be established with business and industry with regard to this facet of education.
   6. The element of local control will encourage the adjustment of the technical education program to both the needs of people and the needs of business and industry.

B. Possible Limitations
   1. Establishes a separate tax authority for the same tax base as that established for a joint vocational school district.
   2. Requires an administrative organization specifically for this one type of education.
   3. Certain of the laboratories needed for short periods of time are expensive for use for this one purpose only.
   4. There is a duplication of certain laboratories and shop facilities included in a joint vocational school.
   5. A curriculum developed with transferability in mind will likely not produce quality technical education.
   6. There is a history of the desire of such technical institutes to become four-year degree granting engineering centers.

III. Community Colleges

Community colleges are normally organized to provide: (1) transfer programs giving credit toward baccalaureate degree programs at universities and colleges; (2) technical education programs preparing people for para-professional occupations, which programs may or may not accrue college credit toward the baccalaureate degree; (3) vocational training; and (4) community service programs of an adult education nature. In such institutions both the transfer collegiate curriculum and the technical education curriculum lead to a granting of the associate degree upon the completion of a two-year program.

A. Possible Strengths
   1. The community college is community oriented and will give careful consideration to the interests of people and of business and industry in the areas served.
   2. The community college provides partial local financing for both construction and operation.
   3. Technical education is placed within a reasonable driving distance of the homes of the students.

4. Due to local and State participation in the construction and operation, the cost of technical education to the student is maintained at a reasonable rate.
5. Costs of administration for a college transfer program and the technical education program are reduced by reason of the one administrative board.
6. Under this plan there would be a single administrative authority.
7. The program remains responsive to changing needs within the local area.

B. Possible Limitations
1. A curriculum developed with transferability in mind will likely not produce quality technical education.
2. The community college represents a separate tax authority which may be in addition to a joint vocational school district, and could be in addition to a branch university center.
3. Such community colleges may tend to grow into four-year collegiate institutions, in which cases the two-year technical programs receive less emphasis, since the emphasis tends to be placed upon the professional areas.
4. On the basis of the law of social gravity, finances and emphasis in a community college tend to move toward a collegiate transfer program, rather than a technical education program. Also, enrollment tends to follow the law of social gravity unless the students in the technical programs are pacified by the granting of baccalaureate degree credit for the curriculum completed.

IV. University Branches

A university branch is a local part of a sponsoring university, but located in an urban area separate from the main campus. The purpose of the university branch is to decentralize the lower division of instructional activities in a State assisted university. The university branch is tied to and administered by the parent university and the programs and standards are expected to be those of the parent university. The university branches in some States can legally offer technical education programs.

A. Possible Strengths
1. Technical education students who change their goals and decide to pursue baccalaureate degree programs may find it easier to obtain recognition of course credits by the parent university.
2. The status symbol attached to the university will tend to encourage enrollment of students into the programs, many on a part-time basis.
3. The administration and funding of the branch is provided through the parent university under the direction of the State Board of Regents.

B. Possible Limitations
1. The tendency in the branch is to organize technical education on the basis of courses offered in the lower divisions of the baccalaureate degree programs.
2. If the baccalaureate degree standards maintained at the central campus are maintained at the branch, many students who could succeed in technical education will be denied entrance or be unable to achieve at an acceptable level.

3. A number of students will enroll in the technical education curriculum on the basis of the status symbol of the university, believing they are enrolling in a university program. Such students will have little interest in preparing for a technical occupation upon graduation. A great number will enroll on a part-time basis and will never graduate.
4. Most university branches are not adequately equipped with the necessary laboratories and shop facilities to provide for a sound technical education program.
5. Finances available to a university and to a university branch will tend to flow to the programs of highest status, the transfer programs in the branch and the graduate programs on the parent campus.
6. There is a tendency for programs in the university branch to be central campus oriented, with little direct contact in relationship with business and industry in the local area to be served, and close relationships with business and industry are necessary for the further development of sound technical education programs.
7. Since the status programs are transfer programs, enrollment in the technical education programs would generally decrease as students feel that they are secondary citizens in relationship to the transfer programs.

V. Colleges and Universities

Technical education programs operated by universities and colleges tend to have the same possible strengths and possible limitations as identified for the university branch.

Technical education will grow best if it is identified as a unique program, in a unit separate and apart from institutions offering transfer programs to universities and in a unit in which the students are not looked upon as second class citizens. There is a tendency for technical education organized in relationship to a university to become perverted to the issuance of college credit for the baccalaureate degree.

Technical education in the community college also can be placed in a secondary citizenship role unless there is an intensive effort made on the part of the administration to promote enrollment in identifiable technical education programs and to maintain strong relationships with business and industry in relationship to the goals, curriculum organization, and staffing of the technical education programs.

CONCLUSIONS

Acceptance of the ideas or concepts expressed within this position paper would lead to the following conclusions:

1. Vocational and technical education are essential parts of the modern curriculum for public education.

2. Public education has a responsibility for and an obligation to vocational education for high school youth, out-of-school youth and adults, in terms of preparatory training, retraining, and upgrading instruction for employed workers.

3. The needs of youth and adults for vocational education suggest that a minimum scope of programs requires an enrollment of approximately 500 youth in a center for vocational education. An optimum program of vocational education can be reached with an enrollment of 1300.

4. Needs of out-of-school youth and adults for technical education and the needs of business and industry for graduates of such programs suggest a minimum enrollment of 500 post-high school technical students in order to achieve minimum scope of program.

5. Large cities of 200,000 or more normally have sufficient tax base and student base to provide for a comprehensive vocational education program. Several options are available to large cities in terms of adequate organization for vocational education, but the pattern selected must provide for comprehensiveness of the vocational program in keeping with the nature of the students and the community, and for continuing services to out-of-school youth and adults.

6. Most suburban and rural communities do not have sufficient student base or tax base to provide for vocational education unless such districts join together to provide sufficient student base and tax base to support a comprehensive vocational program.

7. In some sparsely populated areas, it will be impossible to provide even a minimum comprehensiveness of vocational program at the high school level due to the great distances between the school districts involved. In such cases, residential type programs must be considered, either on a high school basis or on a post-high school basis for both vocational and technical education.

8. Vocational and technical education programs are sound educational programs planned to serve the needs of people and of business and industry and deserve the full support of people concerned with the modernizing of the educational program throughout the Nation.

Just as nature deplores a vacuum and makes every effort to fill the vacuum, so society deplores a vacuum in terms of the needs of that society and makes every effort to fill such needs. Public education within the fifty States has a short time in which to accept its responsibility for the total student, including his preparation for employment, and the responsibility for continuing education for out-of-school youth and adults. Unless this need is met by the individual States such an educational program will be provided under the auspices of the Federal Government.

The Way It Is[1]

THE WAY IT IS

State Vocational Education Directors
Dallas, Texas
December 7, 1968

I don't really have the words to tell you how much I appreciate the invitation to be here today. Perhaps some of you can realize how much fun it is to get far enough away from home to be an expert and perhaps thus to be somewhat appreciated. (Story of Get-Well card.)

When I think of the invitation I feel compelled to tell you a story that I haven't used for some time, but it seems appropriate now. (Cowboy twirling the rope.)

Having made very clear, then, that Cecil Stanley is responsible for my being here, I must quickly and most seriously tell you of my very high regard for him. If he is at all typical or representative of this group of vocational educators, or perhaps I should say if you are all cut of the same fine cloth he is, then this is one of the finest leagues I have ever worked in. In fact, it makes me wonder how I ever got into the auditorium and reminds me of the story of the Nebraska Vocational Agriculture teacher who entered his mule in the Kentucky Derby some years ago. When asked why he had done this, he answered that he thought it would be a very fine educational experience for his mule to associate with such outstanding horses.

Some years ago I read an old Chinese proverb which goes something like this -- There are five points to the compass: North, South, East, West, and Where You Are. I haven't used this for years but it seems rather appropriate as I begin my assignment today.

We are in Dallas, Texas -- a great City in a great State -- on December 7, 1968 in the sunset weeks of a year many people will be glad to leave behind -- a year which can well be characterized by such key words as violence, frustration, revolution, brutality, power, controversy, disadvantage, relevance, credibility, change.

In another revolutionary time citizen Tom Paine said: "These are times that try men's souls." And surely 1968 is such a time and among those men whose souls are being tried, we must include those of us who are in this room today.

Another writer-philosopher, in speaking of a more recent period, said (and I quote rather loosely): "These are the best of times and the worst of times. Nobody knows and everybody guesses", etc.

There are some elements, factors, developments, truths -- call them what you will -- which relate to one of those most significant key words - change - and which help describe where we are or the way it is. These are matters which cannot be shouted out of existence, which cannot be distorted or ignored into oblivion, which cannot be solved by change and counter-change nor by retreat nor appeasement. They will have to be faced; if not today -- tomorrow; if not tomorrow -- the day after. If not the day after -- the year after and the decade after. But they will have to be faced.

In "Focus on the 70's" Harrison Brown of the World Book Year Book Board of Education pointed out that world society is fissioning with two kinds of human beings evolving -- the affluent and the miserable.

In the developed countries research, development and industry all accelerate to provide a positive feedback cycle in which richness breeds richness according to Brown. In the undeveloped, there is a negative feedback whereby poverty appears to intensify poverty.

Similar kinds of fissioning are going on -- some , if not all, of extreme importance to government, to education, and especially to vocational education. For example, large cities are growing larger while small cities and villages grow smaller. Within metropolitan

areas the suburban fringes are growing wealthier while the inner city is losing wealth and gaining human liabilities.

Farms are getting larger and fewer in number. Farmers are more technical, professional or sophisticated, but fewer in number. Yields are becoming greater from a smaller number of acres. The United States and Nebraska as well are classified as urban rather than agrarian, and the big impact of the one man--one vote idea is yet to come.

In anything that requires transportation, time has become a much more significant factor than distance. Watch your highway signs, especially on the freeways -- so many minutes or hours to tourist attractions, food stops, motels or cities. Trans-oceanic flights are planned in terms of hours and minutes, cross-winds, head-winds, tail-winds.

The lines which circumscribe governmental units become more artificial by the day. State lines in the Chicago, New York and Washington, D.C. areas are probably more negative to good government than helpful. County lines in many areas, especially metropolitan areas, are similarly obsolete, their obsolescence perhaps showing most in school district organization and in law enforcement.

A major problem in 1968 is that of national minds in an international world, of 18th and 19th century thinking in a 20th century world which needs to be educating for the unknown needs of the 21st.

The role of government in our society is changing and the capacity of people to govern themselves is being challenged as never before. The idea that that government governs best which governs least was most relevant and accurate in 1787. Now in 1968 it is as out of date as yesterday's newspaper, as obsolete as button shoes, as 18th century as a lamplighter making his rounds when darkness falls. To me it is not a bit too idealistic to say that government governs best which is most responsive to the ever-changing needs of the people from which it comes.

Because of the knowledge explosion and technological advances in communications and transportation, we live in the day of the revolution of rising expectations on the part of have-not nations, minority groups, disadvantaged children, of parents whose children are captives of an inferior school district in Nebraska (and in our 1995 districts there are a few inferior ones).

The church, the school, the State of Nebraska and all the other states represented here, Commissioners of Education, State Departments of Education, Divisions of Vocational Education, are not immune to challenge and change. No person, no idea, no institution can say as I did years ago in some of our boyhood games -- Kings' Ex -- and then be free from the impact and the reality of change.

In between a consideration of these changing times and the influence of these times upon education and vocational education, I should like to take a moment to mention some things that are completely stabilized, completely solid, as far as I am concerned. I am thinking about my long-time commitment to vocational education as an important viable, integral part of a comprehensive program in education. I am thinking about my belief that excellence in education is not the monopoly of academic education, but can be found and must be always sought in vocational education. I am thinking about my commitment to having vocational education be an integral, wholesome, significant part of the organization of a state educational agency. I am thinking about the only justifiable role of any state educational agency -- that of providing enlightened leadership.

This is the season for Christmas greetings and good wishes for 1969. I wish that every Chief State School Officer in the United States could have the fine kind of personnel and leadership in his Division of Vocational Education as we in Nebraska have in ours. I wish every Chief could have the high type of working relationships that I have with our Vocational Education people.

Last summer there was a very important meeting held at the University of Nebraska. It was attended by less than 100 persons, some of whom might not have realized how significant it was. But let me assure you that it was more important than another meeting where 67,000 people saw K-State manhandle Big Red from Cornhuskerland. If any of you are from Oklahoma, I apologize for not citing the Nebraska-Oklahoma game. You see there were fewer people there and it was in Norman.

JARRING STATEMENTS came from Congressman Roman C. Pucinski (D.-Ill.) last June when he spoke to the National Seminar for Selected College Deans here in Lincoln. The very title of his talk was the initial jolt-- *"Career Education - Key to Our Survival as a Free People."* These words would suggest a most precarious state of the nation, and that certain changes needed in our educational curriculum are matters of the gravest concern.

The Congressman referred to the Poor Peoples March, which was held in our nation's capital last June:

> . . . one of the root causes of that march is simply this: our nation's educational system has failed the very people who . . . camped in Resurrection City . . . . It has provided them with no marketable skill. Nothing with which to provide them a decent living wage. No sound notions of how to go about looking for a job. Dressing for a job. Acting on the job. Or holding a job.

The Senator went on:

> Unemployment is always a tragedy because it is a waste of human resources. But *youth* unemployment is a national tragedy.
>
> . . . Almost $2 billion has gone to the states for vocational and technical education. The federal contribution has jumped since 1963 from 16 to 26 percent of total expenditures for vocational education. And we have multiplied high school enrollments in vocational education by 42 percent. Why then not congratulate ourselves? Why not boast of our achievements? And assume a job well done?
>
> --Because students with special needs -- the ones with the greatest unemployment -- have been forgotten. Fully one-third of our local school districts have no program at all for these hard core, youthful unemployed.
>
> --Because only a quarter of our high school students take vocational education. Just 3 million of a total 12 million students receive career education, even though 80 percent of them will never receive a college diploma.
>
> --Because technical fields are crying for manpower, But only four percent of vocational students are training for them . . . .
>
> --Because 50 to 60 percent of the high school graduates who go job hunting immediately following commencement are ill-prepared for work.

With the passage of the Vocational Education Act of 1968 Vocational Education really takes its place in the sun.

Actually, it has always had a bright place in the sun, but that place has been obscured by the smog of:

insufficient moral and financial support

intellectual snobbery - educational segregation

ineffective and inadequate communication resulting in a lack of understanding and appreciation

lack of relevance of too much that was labeled vocational education

over-sensitivity and defensiveness of some vocational educators.

So, in spite of the explosiveness of these days, the AVA meets in Dallas when the opportunity for rejoicing is bigger even than the great State of Texas. You -- we -- can rejoice very much as a successful candidate rejoices with election results.

And then morning comes -- the moment of truth -- the realization of tremendous responsibility that always accompanies opportunity. Now to use a homely and trite phrase -- it's put up or shut up.

In the next few minutes I'd like to place out in front of you -- on the counter so to speak -- some notions I have about what we need to do and why we need to do them.

WE WHO ARE CHIEF STATE SCHOOL OFFICERS:

Must do everything we can to keep vocational education in the ball park of comprehensive education. It is not an appendage. It never has been and must never be permitted to become one.

Must correlate, coordinate, integrate the several divisions in our state agencies better than ever before. (This is no small task -- ex. 6 or 8 different Federal programs for disadvantaged.) This means doing more than coming to Dallas to make a speech or listening approvingly to someone else make one.

We need to encourage a meaningful dialogue about society's educational effort in its entirety. This will not be easy for we have perhaps been too successful in making school and education synonymous. But unless and until we do accept and work with this total picture, says Lawrence A. Cremin (World Book Year Book Board, referred to earlier), we will not "recognize the incredible potential of the classrooms that have developed in industry, in churches, and in fraternal organizations, of some form of universal national service, of educational television." (Refer to World Herald clipping.)

Must do what we can to bring about necessary changes in teacher education for without well-trained, highly committed vocational teachers in the classrooms we shall do little more than spin our wheels.

Must do what we can to help our general school administrators in each of our states develop and act upon the insights we have spoken

briefly about and which will loom very importantly in these next few days.

WE WHO ARE DIRECTORS OF VOCATIONAL EDUCATION MUST:

See that our staff members renew, modify and enlarge their commitments to educational excellence, generally to comprehensive education and very specifically to vocational education so that they in turn can do the same for their colleagues at the local level.

Make the comprehensive high school live up to its promise

Begin in the elementary school to develop a meaningful, positive understanding of the world of work

Enlarge our concern for career development as opposed to sheer job skill training

Keep our instruction updated and relevant. (Rigidity, stuffiness, irrelevance are bad enough in the so-called liberal arts, but they're downright sinful and wasteful in vocational education. And they show up about as fast and about as disastrously as pre-forward pass football would on any Friday night or Saturday afternoon in October.) Again, parenthetically, Cecil Stanley and I to the extent of our budget, approve every legitimate request that will get our State House and Technical School staffs back into the world of work -- we're not sure this is as sufficiently well done at the local level.

Individualize instruction so that we can do a better job with the youngsters at the margins. We need to open up and loosen up opportunity for more education; "education that can start and stop and start again; education in which a student can enter the system easily and leave it easily; short-term education, long-term education, education of every sort and variety."

Involve actively the entire community and use it as the natural laboratory it really is.

Think bigger about vocational education, taking into account the fast-developing service and technical fields, as well as the broad range of vocational options beyond the high school

(Tell story of drunk who was jailed.)

Answer again the question of why are we here. State education agencies have many roles, many responsibilities, but the major one is that of providing "enlightened leadership." That's why we're here! And our attitude should be one of "Let's get at it!"

How important is it that we don't muff the golden opportunity vocational education now has?

First, we may never have a better opportunity if, indeed, we have another.

The continued success of public elementary and secondary education might very well be riding on how well we carry out the provisions and promises of the Vocational Education Act of 1968.

And in my mind there are no mights about the continued existence of public school vocational education. If we don't succeed -- you have, we have, I have had it, and I have some strong notions as to who is waiting in the wings to pick up the pieces.

These changing, explosive, terrible, wonderful times are a challenge to everyone but especially to those of us who in some small way are agents of change.

As you meet in 1968 and consider your role in 1969, may I suggest that you lift your head toward the stars, place your shoulder to the wheel, see that your sleeves are rolled up, keep your eyes on the ball and your feet on the ground.

If you are not contortionist enough to accomplish that, let me put it another way, somewhat more professionally -- let us do everything we can whoever we are, wherever we are, with whomever we work, to look at things as they are and to plan with courage and objectivity for what they should be.

Definition of Vocational and Technical Education[1]

by

Byrl R. Shoemaker

Director of Vocational Education

State Department of Education

Columbus, Ohio

[1]Presented at the 62nd Annual Vocational Convention, Dallas, Texas, December 11, 1968.

DEFINITIONS OF VOCATIONAL AND TECHNICAL EDUCATION

Technical Education

Technical education is an area of education more practical than the professional and more theoretical than that of the craftsman. A new area of education, not a watering down of professional education, and not an upward extension of trade or vocational education. A level of education to prepare for new levels of employment in business, industry, agriculture, distribution, health and the social sciences concerned with functions of design, development, testing, supervision. A program to prepare people to work as para-professionals in a team relationship with a professional.

Technical education is a level of education that is growing in keeping with our technological revolution. It's growth is based on the concept of the increasing requirements and changes in assignments in the professional field, and the shrinking number of professional people per thousand of population. This level of education is planned to prepare para-professional people in two-year post-high school programs to work in a team relationship with professional people in engineering, business,agriculture, distribution, health, social science, and public service.

Vocational Education

The primary purpose of vocational education is to equip persons for useful employment. The program is designed to serve the needs of people in two distinct groups. First, adults who have entered upon, and second, youth and adults who are preparing to enter occupations in agriculture, business, homemaking, distribution, trade, technical, and industrial fields requiring less than a college degree.

Vocational education is concerned with the preparation of people for construction, maintenance, repair and servicing occupations.

Vocational education helps to give definite purpose and meaning to education by relating it to occupational goals. It provides the technical knowledge and work skills necessary for employment; but is more inclusive than training for job skills. It develops abilities, attitudes, work habits, and appreciations which contribute to a satisfying and productive life.

Vocational education contributes to the general education needs of youth, such as citizenship, respect for others, acceptance of responsibilities; but it makes its unique contribution in the field of the preparation for work.

Examples of Team Relationships in Employment

Industrial

Professional	-	Mechanical Engineer
Technical	-	Tool and Die Designer
Skilled	-	Tool and Die Maker
Semi-Skilled	-	Drill Press Operator

Business

Professional	-	Accountant (College Graduate)
Technical	-	Business Data Computer Programmer
Skilled	-	Unit Record Operator
Semi-Skilled	-	Clerk

Agriculture

Professional	-	Agriculture Engineer
Technician	-	Agriculture Equipment Distributor

Skilled	-	Agriculture Equipment Repair
Semi-Skilled	-	Agriculture Equipment Delivery

Health

Professional	-	Dentist
Technician	-	Dental Hygienist
Skilled	-	Dental Assistant
Semi-Skilled	-	Dental Office Clerk

Social Science

Professional	-	Lawyer
Technical	-	Tax Technician
Skilled	-	Stenographer
Semi-Skilled	-	File Clerk

PROBLEMS OF ADMINISTRATION AND SUPERVISION OF INDUSTRIAL ARTS: THE ROLE OF THE STATE DEPARTMENT OF EDUCATION VOCATIONAL CONSULTANT

Edward T. Brown
Regional Curriculum Project
156 Trinity Avenue, S. W.
Atlanta, Georgia 30303

Prepared for Presentation at the 62nd Annual
Convention of the American Vocational Association

"National Conference of State and Local
Supervisors of Industrial Arts" Session
December, 1968

THE ROLE OF THE STATE DEPARTMENT OF EDUCATION CONSULTANT

First let me report to you the source of my data for this report, the portions of the data that I will use, and then the two major questions that I will try to answer.

The Regional Curriculum Project is a six state cooperative activity centered in Atlanta, Georgia. The participating states are Georgia and the states that border on it. Our purpose was to help strengthen state department of education instructional consultant staffs (including the vocational education divisions) in their work with local schools.

As part of our status study we interviewed 180 of these consultants; sixty of them were in the vocational divisions and six of them were consultants of industrial arts. We also interviewed the directors of the instructional or curriculum services divisions and the vocational divisions.

Today, I will compare the vocational responses with those of instructional services, and then compare the vocational consultants' responses with those of their bosses—the directors of the vocational divisions. Thus my two questions are:

> How does the vocational consultant differ or work differently from the academic area consultant?
>
> Does the director have an accurate picture of how his vocational consultants work?

To begin the answer to question one, let's look at the first open response question asked by the interviewer when rapport with the interviewee had been developed. What did the consultant see the purpose of his job to be? The responses were recorded and later transcribed. A general summary of responses from instructional division staff would classify them as more general in describing the mode of performing the functions, as well as broader in scope and content than those from vocational division staffs. Instructional consultants used the terms "help," "provide," "give leadership," "work with," for example. Vocational staff used the terms "supervise," "interpret," "administer," "place," "coordinate," "set standards," "expand programs," and "serve as consultant;" in their context these latter terms seemed to be more definitive than those from the instructional consultants. In scope and content, instructional staff more frequently mentioned the whole school program, accreditation, awareness of a good curriculum, and awareness of new and changing curricula. Vocational staff, in contrast, more frequently restricted their comments to their program, the state plan, and instructional and program improvement. The emphases of vocational staff were on installing new specific programs, and expanding and improving existing programs. Instructional staff seemed to be more concerned with leading, assisting, and advising school staff in the total school program.

The first checklist type question concerned where requests for services came from and with what frequency; and I'll use the five-point continuum of never (1), rarely (2), sometimes (3), often (4), and frequently (5) to report results.

The two divisions were alike in getting requests from

principals - often,
superintendents - often,
SDE colleagues - often,
professional organizations - often,

colleges - sometimes,
lay groups - sometimes,

school boards - rarely.

Vocational consultants got frequent requests from teachers (4.22 mean response) but instructional staff received requests from teachers only sometimes (2.92). Also, vocational consultants often (3.06) were requested to do regulatory work but instructional staff were requested to do so only sometimes (2.32).

In contrast, instructional consultants got frequent (4.24) requests from supervisors while vocational staff received requests only often (3.16). And, instructional consultant staff often (3.60) received requests from district office staff but vocational people receive requests from them only sometimes (2.91).

Now, let's see with whom consultants work. The two divisions are alike in working with

groups of teachers - frequently,
individual principals - often,
SDE colleagues - often,
individual supervisors - often,

groups of superintendents - sometimes,
lay groups - sometimes,
college groups - sometimes,
professional organizations - sometimes,

school boards - rarely.

Now let's look at the differences—vocational staff work frequently with individual teachers (4.41) and individual superintendents (4.00) but instructional staff only work with these individually often (3.08 and 3.45). In contrast, instructional staff work with the following persons often while vocational staff only work sometimes with each group:

groups of principals (3.25 and 2.39),
groups of supervisors (3.37 and 2.70),
individual district office staff (3.10 and 2.67).

Also the instructional group sometimes worked with groups of district office staff while vocational staff only rarely (1.94) worked with them.

The next item concerned how SDE consultants contacted or maintained contact with local school people. As you would expect visits, mail (letters and newsletters), and telephone were frequently the means; team visits were often used; and TV only rarely was used. Vocational staff used the mail with slightly greater frequency than instructional services staff.

In following up initial contacts vocational staff made subsequent visits with greater frequency than did instructional people, who did so only often (4.11 vs. 3.75).

The consultants also were asked the extent to which they themselves and the department evaluated their work. Unfortunately, we did not ask also how evaluation was conducted. The responses on extent of personal evaluation were very similar: about half of the respondents in each group reported that they made extensive personal evaluation of their work; only about ten per cent in each group reported limited evaluation.

Consultants' reports on the extent to which the department evaluated their work varied. About one-third of the vocational staff reported extensive evaluation and only about ten per cent reported limited evaluation. In contrast, about ten per cent of the instructional consultants reported extensive evaluation and about 40 per cent reported only limited evaluation. The vocational division staff apparently received more evaluation. In case you're wondering, only eight per cent said no evaluation occurred and the others checked the rating moderate.

Another item asked the consultants to check the frequencies with which seventeen activities were performed in their work. Vocational and instructional consultants reported similar frequencies for eleven of them, including

participate in workshops - frequently,

assist in accrediting evaluations - often,
assist in evaluation - but not accreditation - often,
help develop curriculum guides - often,
write and distribute curriculum materials - often,
prepare bibliographical listings - often,
collect and distribute curriculum information - often,
provide names of resource people - often,

teach demonstration lessons - sometimes,
arrange inter-system visitation - sometimes,
work with lay groups - sometimes.

Vocational consultants performed each of six activities more frequently than did instructional consultants. Five of these six were performed frequently by the vocational staff and only often by the instructional staff:

visit in classroom (4.39 vs. 3.63),
help plan workshops (4.27 vs. 3.95),
participate in professional organizations (4.04 vs. 3.86).
help plan programs for Federal funding (4.03 vs. 3.45),
orient new personnel (4.03 vs. 3.04).

One other, "help select textbooks," was often done by vocational staff but only sometimes (2.53) done by instructional consultants.

Another list of these same activities was given to each consultant with the request that he check the five he considered most valuable—most productive for his work. Generally—that is, in most items—there was little correlation between the frequency with which the vocational consultant performed an activity and the relative importance he assigned to it. Here are some that were performed frequently, with the percentages of respondents who categorized them as being among the five most valuable:

visit in the classroom (78%)
orient new personnel (56%)
help plan workshops (56%)

In contrast, some of the activities performed frequently did not rate high in value:

help develop programs for federal funding (34%)
participate in professional organizations (14%)

Several activities that were often performed were rated to have high relative value—and this might be a suggestion that these activities should be emphasized more:

help evaluate programs (other than accreditation) (44%)
help develop curriculum guides (52%)

The longest list is of activities which vocational consultants reported performing often, but which very few of them included in their choices of the five most valuable activities:

work with lay groups (16%)
write and distribute curriculum materials (12%)
help in accreditation (8%)
help select textbooks (6%)
provide names of resource people (6%)
prepare bibliographical lists (4%)

This might be a suggestion that the vocational staff does too much of some things.

Thus ends the data report for the first question.

The second question had to do with whether the division directors knew what vocational consultants did. The six directors—one in each state department—were interviewed with the same instrument.

Their responses indicated that they knew consultants received requests from

principals - often,
SDE colleagues - often,
supervisors - often,
professional organizations - often;

and from lay groups - sometimes;

and from school boards - rarely.

Directors thought consultants got more requests from superintendents than they actually did.

Directors said frequently (4.17); consultants reported only often (3.68).

In contrast, directors thought consultants got fewer requests from teachers, for regulatory duty, from district office staff, and from colleges than the consultants reported.

Directors said consultants often (3.83) got requests from teachers; consultants reported frequent requests (4.22).

Directors thought consultants only sometimes got three kinds of requests that were really often made:

for regulatory duty (3.06 vs. 2.83),
from district office staff (2.91 vs. 2.33),
from colleges (2.87 vs. 2.17).

Directors' perceptions of whom consultants work with also was not as accurate as it could be; of the fifteen items in the checklist, the director thought consultants worked more often with seven categories than they actually did.

Directors were correct in their perceptions that consultants worked

frequently with individual teachers,
frequently with groups of teachers,
frequently with individual superintendents;

often with individual principals,
often with SDE colleagues,
often with professional organizations;

sometimes with college groups.

Now let's enumerate the directors' incorrect perceptions. Consultants reported often working with individual supervisors, rather than frequently as the directors said (3.33 vs. 4.17).

Consultants reported working with several categories sometimes while directors said often:

groups of supervisors (2.70 vs. 3.33),
individual district office staff (2.67 vs. 3.33),
groups of principals (2.39 vs. 3.33),
groups of superintendents (2.08 vs. 3.33),
lay groups (2.49 vs. 3.00).

Consultants reported working only rarely with groups of district office staff, but the directors thought this sometimes occurred (1.94 vs. 2.83).

The next items concerned how consultants contacted local school people and followed up their work. Directors and consultants agreed, except on the following points:

Directors didn't realize that consultants used the telephone as frequently as they did (4.18); directors estimated only often (3.67).

Directors thought consultants contacted local school people in teams only sometimes (2.83), though this occurred often (3.16).

In follow-up activities, directors did not know the extent to which consultants made subsequent visits. Consultants reported doing so frequently (4.11), and directors estimated often (3.83).

The directors of the vocational divisions had excellent perceptions of the extent to which the various work activities were performed by the vocational consultant staffs. For thirteen of the seventeen listed activites, directors' perceptions agreed closely with the consultants' reports.

Directors thought consultants performed two activities less frequently than the consultants reported performing them:

> Consultants frequently visited the classroom; directors said often (3.67).
>
> Consultants frequently oriented new personnel; directors said often (3.33).

With two other activities, directors thought the frequency of performance was greater than that reported:

> Directors said consultants helped develop curriculum guides frequently (4.67); consultants reported doing it only often (3.84).
>
> Directors said consultants collected and distributed curriculum materials frequently (4.17); consultants reported doing it only often (3.76).

From the same list of activities each director was also asked to select the five he thought most valuable to his staff. Except for three of the seventeen activities the directors' and consultants' perceptions can be said to have been in agreement; the proportions selecting each activity were comparable.

Directors placed less value than consultants did on "visiting the classroom" (50% vs. 78%).

A greater proportion of the directors than of the staff considered "helping to develop curriculum guides" to be valuable (38% vs. 52%).

Directors, more than staff, considered "collecting and distributing curriculum information" to be valuable (50% vs. 24%).

In quick summary, then, let's answer the two questions.

How do vocational division consultant staff differ from instructional division consultant staff?

Vocational staff receive requests from teachers and for regulatory visits more often, and less frequently receive requests from supervisors and district office staff. They more frequently work with individual teachers and individual superintendents and less frequently work with groups of principals, supervisors and district office staff, and with individual district office staff. To contact local school people they use the mails and team visits more often, and more frequently follow up initial contacts with subsequent visits. The vocational divisions make more extensive evaluation of the work of the consultants. They perform more frequently these activities: visiting the classroom, helping develop programs for federal funding, orienting new personnel, participating in professional organizations, helping plan workshops, and helping select textbooks. It should also be added that vocational staff perform with some frequency some activities which they do not consider to be valuable.

The second question was:

Does the vocational director know what vocational consultants do?

The director thinks the consultants get more requests from superintendents than they do; and he thinks they get fewer requests from teachers, district office staff, for regulatory duty, and from colleges than they do. He thinks the consultants work more frequently than they do with individual supervisors, groups of principals, groups of supervisors, individual district office staff, and groups of superintendents. Consultants work more frequently than the director thinks with groups of district office staff, school boards, and lay groups. The director doesn't know his staff uses the telephone, visit in teams, or follow up by subsequent visit as much as they do. The director is not aware that consultants visit classrooms and orient new personnel as much as they do; and the director thinks they help develop curriculum guides, and collect and distribute curriculum materials more than they do. Also, it should be added that the vocational consultants rate visiting classrooms higher, and helping develop curriculum guides and collecting and distributing curriculum information lower, than the director does.

ECONOMICS OF VOCATIONAL EDUCATION*

J. Robert Warmbrod
Professor of Agricultural Education
The Ohio State University
Columbus, Ohio

Some Quotes About the Economics of Vocational Education

"Vocational education . . . is an expensive terminal training program . . . alternative programs for . . . on-the-job training should be considered" (Corazzini, 1966). These quotes are some of the conclusions from a case study, published in 1966, of the benefits and costs of vocational education in Worcester, Massachusetts.

Another study of the costs and benefits of vocational education resulted in these conclusions: "Our findings about the value of the vocational program in New York City high schools . . . are disquieting . . . our review . . . suggests that returns have been meager relative to the considerable social investment in the program . . . solid evidence in support of the city's vocational program is sadly lacking" (Taussig, 1968). These findings were first reported during a conference on vocational education held in 1967.

"Most studies indicate that vocational education costs about twice as much as other secondary education . . . . research also indicates that the monetary benefits are similar for the major secondary education curricula. If . . . monetary benefits are accepted as a proper performance index, . . . educational resources are being badly allocated. Greater educational benefits in monetary terms could be gained by shifting resources away from vocational education in high schools to other types of education, perhaps toward academic programs or

work-study programs using the capital facilities of employers" (Kotz, 1967).

At best, these statements by economists cannot be construed as complimentary to vocational education. In fact, each questions seriously the economic value of vocational education in the public schools.

The foregoing statements, made in 1966 and 1967, should be considered in light of the following statement made by another economist in 1965. "I wish I could report that economists had taken a thorough look at the whole system of vocational training in the United States . . . . I wish I had a fistful of statistics to throw at you, including the effects of certain types of training on unemployment and earnings, and the costs and benefits of alternative training systems . . . but right now it is not possible. The plain fact is that economists have ignored the whole subject of vocational education almost completely and are just beginning to recognize its importance" (Rivlin, 1965).

The quotes I have cited are evidence that since 1965 the economists have not ignored vocational education. But let us take a further look at what other persons and groups have to say about the economics of vocational education. The Advisory Council on Vocational Education (1968) in their national assessment of vocational education mandated by the Vocational Education Act of 1963 concluded in their report, issued in 1968, that "Studies relating the costs of vocational education to the benefits derived have given it solid support. When controlled for differences in native ability, vocational students profit substantially as compared to others in both employment and earnings." So we get a different assessment of the economic value of vocational education from a group composed primarily of vocational and general educators and representatives of business and industry.

I shall quote the conclusions of one additional study in this overview of the economics of vocational education. This study, the most recent that I am

aware of, was conducted by an economist to compare the cost-effectiveness of vocational and nonvocational education in secondary schools. The conclusions read as follows: ". . . additional public funds should be spent on the vocational-technical curricula rather than on the nonvocational-technical senior high school curricula . . . . by comparing the costs of the different curricula with benefits measured in terms of earnings, the return to investment in vocational-technical education was shown to be considerably greater than the return to investment in the alternative curricula . . . . the evidence is clear. Vocational-technical education is an economically worthwhile investment for individuals and for society" (Kaufman, Hu, Lee, and Stromsdorfer, 1968).

Note that this economist's conclusions were different from the conclusions quoted earlier. I believe comments later in the paper will show that the study just quoted is not only the most recent but also the best designed and most thorough. These factors may have something to do with the conclusions reached.

Board Members' Concerns About the Economics of Vocational Education

With this overview of what some persons, primarily economists, are saying about the economics of vocational education, I want to make clear the context within which I am speaking. I conceive the primary role of members of boards of education to be policy development and enactment. I am sure that a great deal of the policy decisions with which you are concerned have to do with money--decisions about tax rates, allocation of funds to vocational education, and the allocation of vocational funds to the various programs and occupational categories within vocational education.

So it is within this context that I shall attempt two purposes. First, I want to acquaint you with what is being said and written about the economics of vocational education. Hopefully, this has been partially accomplished, but I shall summarize additional research later in the report. Second, I want to

acquaint you with some of the problems and concepts involved in the study and analysis of the economics of vocational education. Since as board members you must assess the findings and recommendations of others about vocational education, I hope a consideration of some of the problems and issues involved will enable you to evaluate critically the data and recommendations that are made available to you.

Most of my remarks are drawn from a review and synthesis of research on the economics of vocational-technical education which I prepared for the Center for Vocational and Technical Education at The Ohio State University (Warmbrod, 1968). Since most of the research and writing to which I refer is by economists, I wish to make it clear that I am not speaking for economists. My task is to report, as a vocational educator, what they are saying about the economics of vocational education. Naturally there will be some interpretation on my part.

Economics of Education

There are two basic questions underlying much of the research on the economics of investment in education. The first question is: How much more or how much less should we be investing in education? The second question which has specific and direct implications for vocational education is: How much more or how much less should we be investing in specific types of education? A substantial amount of funds was made available for vocational education for the first time by the Vocational Education Act of 1963. The maximum amounts authorized by the recently enacted Vocational Education Amendments of 1968 for grants to states for vocational education programs and research are three times the amount authorized by the 1963 legislation. So you can see that questions like Are these expenditures worthwhile? What returns can be expected from this program? Would an increase or decrease in funds for this particular type of vocational education result in

greater benefits? are very relevant, particularly for board members who are charged with making the final decisions about crucial policy issues.

The research of economists has consistently shown a favorable relationship between an individual's educational attainment and his prospects for employment and subsequent income. In other words, as the number of years of schooling completed increases so does a person's annual income and total lifetime income. Also, it is generally agreed that education yields rates of return on investment both from the point of view of society as a whole and for the individual that are at least as great as the financial returns to investment in corporate enterprise. Education produces a labor force that is more skilled, more adaptable to change, and more likely to develop imaginative ideas, techniques, and products that are critical to the process of expansion, growth, and adaptation to change. So education by contributing to worker productivity, in turn, has positive effects on economic growth. Economists estimate that about one-fifth of the growth in total national income in the United States during the past three or four decades can be attributed to the increased education of the labor force.

Benefits and Costs of Vocational Education

With these rather simplified generalizations about the economic value of education, perhaps we should take a closer look at the economics of vocational education. As with many public social programs today, vocational-technical education is being subjected to rigorous economic analysis. This analysis necessitates that both costs and benefits of vocational education be identified and quantified and, when possible, reduced to monetary terms. The assertion by some persons is that vocational education programs, particularly programs in the secondary schools, should be required to meet the test of economic efficiency, and that alternative methods for achieving the objectives of vocational education should be identified. The questions being raised pertain not only to the

efficient use of resources allocated to vocational education but also to a consideration of alternative programs to which present and additional funds could be allocated for accomplishing the objectives set forth for vocational education.

I shall describe briefly two approaches or techniques being used to measure the benefits and costs of vocational education. Probably the most familiar is cost-benefit analysis. Cost-benefit analysis, first used to assess the costs and probable benefits of natural resource development projects, has as its main concern the optimum allocation of resources. Stated simply, it is an evaluative technique that relates the total value of benefits of a program to the total costs of the program. Its application to vocational education requires that benefits as well as costs be expressed in monetary terms. It will be evident shortly that this requirement creates some difficult if not insurmountable problems. All costs and benefits of the program occurring over time are converted to a present value through discounting so that the present value of net benefits can be divided by the present value ~~to~~ of costs to yield a benefit-cost ratio. In general terms, then, the decision rule states that when the benefit-cost ratio exceeds one, the corresponding activity is economically superior to an alternative activity with a lower benefit-cost ratio. There are a number of conceptual and practical problems associated with the application of cost-benefit analysis to vocational education which it is not necessary to describe here.

Given the conceptual and practical constraints on the application of cost-benefit analysis to educational programs, economists propose that a more appropriate technique for the objective evaluation of vocational education is cost-effectiveness analysis. In cost-effectiveness analysis, indices of benefits of educational programs are retained in their raw form. The output variables or benefits do not need to be economic in nature nor do they have to be expressed in monetary terms. Examples of this type of output variable are trainee's

knowledge as measured on a written test, an employer's rating of the trainee, or some measure of the trainee's level of motivation. The outcome of cost-effectiveness analysis is a statement concerning the effect that a particular program or activity has on the selected output variables and on the cost of the activity. The statement could be in the form of a ratio but more often will take the form of a statement which specifies certain effects associated with the costs of the program.

Measuring the Benefits of Vocational Education

In treating education as a form of investment in human capital, economists differentiate between a consumption component and an investment component. By consumption is meant the immediate satisfaction or enjoyment that people obtain from schooling. On the other hand, investment is the use of resources not for consumption or immediate enjoyment but to increase future productivity. For example, it is argued that general education not only contributes to future productivity but makes life more enjoyable, hence general education is a mixture of consumption and investment. Some economists argue that vocational education, by definition, is undertaken to enhance future productivity and not for immediate satisfaction or enjoyment--or "not for fun" as one economist put it--therefore, expenditures ~~of~~ for vocational education are clearly classified as an investment (Rivlin, 1965).

This rationale makes vocational education very amenable to economic analysis for the return on investment in vocational education is not difficult to measure. In this context, returns to investment in vocational education can be expressed in the form of higher wages to the individual than he would have earned without training. So when data are available on the earnings of similar persons with and without vocational education, the rate of return on investment in vocational

education can be calculated. In other words, the cost-benefit model is appropriate for assessing the economic value of vocational education for benefits as well as costs can be reduced to monetary terms.

But there are others, including vocational educators as well as economists, who argue that there are benefits to vocational education other than directly observable monetary benefits. The monetary value of some of these benefits can be estimated while it is virtually impossible to place a monetary value on others. Some of these additional benefits include reduced unemployment, the holding in school of students who have little or no interest in academic subjects, reduced vandalism and juvenile delinquency, reduced welfare payments, increased motivation on the part of students for further schooling, and the like. Also not to be overlooked are those benefits of education to persons other than the recipient of the education--the recipient's immediate and future family, his neighbors, his employer and co-workers, and society in general. These benefits have been termed external benefits of education (Weisbrod, 1964).

Vocational education surely contributes to the nonmonetary and external benefits of education as does general education. The point I wish to make is this: the assessment of the benefits of vocational education should include outcomes other than monetary. I urge you to consider those benefits as you assess the economic value of vocational education in policy-development and policy-making.

There are other cautions that should be observed when reading studies on the economics of vocational education. A very crucial problem has to do with the use of control or comparison groups. The effects of an educational program on output variables cannot be estimated quantitatively and with a great deal of accuracy unless a control group is used in the design of the study. When graduates of vocational programs are compared with graduates of academic programs, it is rather obvious that these two groups of students may possess different socio-

demographic characteristics and different values, motivations, and other characteristics that affect labor market performance. Again I urge you to take particular notice of this element when vocational graduates are compared to graduates of academic and other nonvocational programs. This fact was overlooked or ignored in some of the studies cited at the beginning of the paper which found that vocational education graduate's performance in the labor market did not differ from graduates of other secondary school programs.

Determining the Costs of Vocational Education

I do not intend to go into any detail about the costs which should properly be considered in assessing the economic value of vocational education. It is important to realize, however, that costs to the individual and to the community include earnings foregone by students in addition to capital costs and current costs such as teachers' salaries, instructional materials, heat, and lights. The matter is far from being simple or resolved, however, for there is not agreement among economists conceptually or operationally concerning what constitutes social costs when cost-benefit and cost-effectiveness analysis is applied to vocational education. Those who have made special studies of this matter (Dueker and Altman, 1967) report that available cost data do not readily lend themselves to coherent analysis and that cost data pertaining to vocational education are not kept in a way which make them accessable for rigorous analytic and evaluative purposes. In fact, the researchers to whom I refer concluded that data are not easily obtained for realistic cost-effectiveness studies of vocational education. This conclusion makes clear another caution that should be observed in assessing cost-benefit and cost-effectiveness analyses of vocational education. That caution is that studies which rely on readily available data indicating cost or benefits, or both, have probably oversimplified the data system required by rigorous economic analysis.

Reports of Research

Now I wish to review briefly findings of some additional studies pertaining to the economics of vocational education. The case studies of benefits and costs of vocational education from which I quoted at the beginning of the paper revealed that (a) vocational education was relatively expensive, and (b) there were not significant differential wage rates in entry jobs for persons with and without vocational education. Hence, the conclusions which questioned the economic value of vocational education. Other pertinent and significant conclusions from these studies are that there were statistical and conceptual problems to be resolved and that there were major gaps in the data used. The researchers were aware of these conceptual and methodological problems, but since these studies were the first relating to the economics of vocational education, the conclusions about the economic value of vocational education received wider publication than did the conclusions of the methodological and conceptual deficiencies of the research.

By way of contrast, you will be interested in more details of the last study from which I quoted in my introductory remarks. As you recall the conclusions of that study about the economic value of vocational education were in rather sharp contrast to the conclusions of the studies just mentioned. The study to which I now refer, directed by Professor Kaufman at The Pennsylvania State University, had as its purpose the comparison, through cost-effectiveness techniques, of vocational and nonvocational education in secondary schools. The labor market performance of graduates of vocational curricula was compared to the labor market performance of noncollege attending graduates of nonvocational curricula, particularly the academic curriculum. An important feature of the design of the study was that the influence of socio-demographic variables such as sex, race, intelligence quotient, marital status, and socio-economic status on labor market

performance was investigated through regression analysis. The findings indicate that over a six-year period following graduation, given both sets of graduates with the same socio-demographic backgrounds, vocational graduates earned $3,456 more than graduates of the nonvocational curriculum, specifically the academic curriculum. Also during the six-year period, vocational graduates were employed 4.3 months more than graduates of the nonvocational curriculum. Hence, the conclusion that the return to investment in vocational education was considerably greater than the return to investment in nonvocational education. Another unique feature of this study is that nonmonetary and noneconomic benefits of the vocational and nonvocational curricula were investigated also (Kaufman, et. al., 1968).

Other studies appear to support vocational education as a sound investment. A study of the costs and returns from investments in a two-year post-secondary technical education program in North Carolina revealed social and private rates of return varying from 17 per cent to 25 per cent depending on the procedures used for projecting future earnings of technical education graduates. Each technical education graduate in this study was paired with a high school graduate of similar academic ability and geographic background (Carroll and Ihnen, 1967). Investigators studying the costs and returns from investment in rural technical schools in Minnesota found that both private and social rates of return on investment in the technical education programs were above or about equal to rates of return from other forms of investment (Pejovich and Sullivan, 1966).

Vocational educators at the University of Minnesota studying the returns to investment in education for farmers found that for each dollar invested by a farmer in a farm business management education program the farmer received a return of $4.20. When community benefits of the farm management education program were investigated, it was found that for each dollor invested in farm business manage-

ment education the community could expect to receive $9.06 in increased business activity (Persons, Swanson, Kittleson, and Leske, 1968).

Closely related to research on the economics of vocational education in the public schools is a considerable body of research using cost-benefit and cost-effectiveness models to evaluate manpower training and retraining programs. These studies, conducted by economists, have been well designed thereby allowing valid conclusions. Generally, the findings reveal benefits attributable to the manpower training programs sufficiently large over costs to leave little doubt but that the training programs are a sound economic investment. When the social-psychological benefits accruing from an unemployed worker returning to the labor market are considered, the researchers note that there is little doubt but that benefits heavily outweigh the costs of retraining (Mangum, 1967; Somers, 1965).

Some Conclusions

What conclusions can be drawn from the research and writings on the economics of vocational education? I propose the following for your consideration.

Research on the economics of vocational education is necessary if adequate and complete data are to be available for making informed decisions concerning the allocation of resources to vocational education. This kind of data will undoubtedly bear heavily on policy decisions about occupational education including the question of which agencies, public schools or otherwise can conduct occupational education programs most efficiently.

Cost-benefit and cost-effectiveness studies of public school programs of vocational education which have been reported to date yield findings which question the economic value of vocational education on the one hand and label it as a sound investment on the other. The number of studies that support the latter position exceed the number which support the former. If cost-benefit and

cost-effectiveness studies of manpower training and retraining programs are considered also, the evidence strongly supports occupational education as a sound investment. From a research point of view there is little doubt but that those studies which find vocational education to be a sound investment are, in general, designed to avoid to a greater degree the conceptual and practical problems mentioned earlier that limit the generalizations that can be drawn from the research. I urge you as policy-makers for vocational education not to accept without question the findings of research on the economics of vocational education.

The usefulness of cost-benefit analysis as an evaluative technique in vocational education is limited by the requirement that all benefits as well as costs be expressed in monetary terms. All benefits of vocational education are not monetary. Some benefits of vocational education, like the benefits of general education, are virtually impossible to quantify monetarily or otherwise. I propose that vocational education, like general education, also has a consumption component, if I may use the economist's term. By consumption component I mean that individuals receive immediate enjoyment and satisfaction from vocational education just as they do from general education. Anyone, economist or board member, who does not think that students enroll in vocational education "for fun" --if I may use a term referred to earlier--as well as to enhance future productivity has not had much contact with students enrolled in vocational courses--or English, mathematics, or history courses--in secondary schools. I urge you in assessing the effectiveness of vocational education to consider, in addition to monetary returns, those benefits which are nonmonetary in nature and difficult if not impossible to measure quantatively. Cost-effectiveness analysis is much superior to cost-benefit analysis as an approach for evaluating vocational education.

And finally, I maintain that vocational educators have a prominent role to play in designing and conducting studies pertaining to the evaluation of vocational education. The vocational educator should apply his expertness to the identification and measurement of benefits of vocational education, both monetary and nonmonetary, that are now overlooked or ignored. Vocational educators and economists can and should work together in designing cost-effectiveness studies of vocational education. Let us not overlook or forget that the chief concern of education, including vocational education, is the nurture and development of individuals. Then the chief concern in evaluating the effectiveness of vocational education is the assessment of change in behavior of individuals and not on measuring the monetary returns the investment yields. The following quote puts it well: "Vocational educators need to look at their teaching more in terms of what it does for the child, and less in terms of how well it meets someone's forecast of the community's industrial needs" (Meade and Feldman, 1966).

VOCATIONAL-TECHNICAL EDUCATION: A PARTNER IN ECONOMIC DEVELOPMENT

By: William H. Seals, Chairman
South Carolina State Board of Education

Economic development is dependent on many factors, however, the most important of all factors is the availability of trained and/or trainable people. Therefore, an inventory of human resources is the first requirement in any plan for expansion or further development of an economic base.

Next in importance is a decision as to what part public education should play in the training of these human resources in an expanded development of programs in Industry, Businceess and Agriculture. At the same time, consideration must be given to what Industry, Business and Agriculture must do for themselves in sharing training responsibilities. In many states public education has made its commitment to an important role in ecomonic development through training programs of both quality and quantity. Perhaps no state in the nation has made a greater commitment than has South Carolina in the further development of its vocational program at secondary and adult levels and its development of a system of Technical Education Centers.

As is the case in all important programs, there must be solid cooperation with all agencies that have the potential for contributing to the program objective. The State Board of Education in South Carolina has been most fortunate in receiving splendid cooperation with County and local School Boards, State and County Development Boards, State Universities, the General Assembly, the Committee for Technical Education, The Employment Security Commission, professional organizations in Industry, Business and Agriculture, Service Clubs, and many other groups.

Planning for economic development must of necessity begin at the "grass roots" level in the area to be served. This is essential if objectives are to be met.

There must be research, studies and/or surveys, to determine the kind of training needed that will promote further economic growth in the particular area.

Only those courses that will meet manpower needs in the community, County or State should be offered in the beginning. This, however, should by no means eliminate training to meet National manpower needs. The process of determining the training to be offered requires close cooperation with Industry, Business and Agriculture. Not only have they contributed to the determination of what courses should be offered but they have assisted in determining course content. Many have gone further by helping to secure instructors. Others have permitted the use of their own personnel for instructional programs. Leaders in the above fields have also assisted greatly in determining space requirements for the various courses to be offered.

The organization and use of local advisory committees made up of personnel of employing agencies has proven most beneficial in all Vocational Programs in both Area and Technical Centers. Such committees assure that the training centers will be continually upgraded and kept up-to-date and that the programs will not become stagnant or meaningless. Advisory Committees can well serve as "built-in" systems of program evaluation. Advisory Committees offer the opportunity to become a safeguard against a very real problem in South Carolina, particularly with adults and out-of-school youth. That problem is the employment of such students before they complete their full training programs. Although such practices can be expected in a tight labor market, it is a very bad one. Such a practice is unfair to both the student and the training institution. The work of a student who accepts employment before he is fully trained may reflect very unfavorably on both the student and the Area Vocational Center or Technical Center and its instructional program.

All Vocational and Technical Education programs are supported by Federal, State and local funds. I believe it is both our responsibility and challenge to provide

the facilities, the equipment, the personnel, and the instructional programs necessary to provide job-skill training to all high school students, those who will enter employment after graduation, as well as college-bound students, and to make available continuous educational opportunities for post-high school students and adults to qualify for job skills or upgrade present skills. All this I believe should be done as a part of a comprehensive high school program. Why is job-skill training so necessary? The reason is twofold - first, to provide students not going to college with a skill to earn a living, and, secondly, to meet the tremendous manpower needs of Agriculture, Business and Industry. Today, there are more jobs than skilled people to fill them. I make no claim that Vocational Education can take a high school student and make a finished product of him or her, but surveys and studies have proven that we can make a boy or girl employable upon graduation from the 12th grade. It is, then, up to the individual student to further improve his or her skills in some form of post-high school training which we can provide.

In my State, recent studies show that students who graduated in recent years represented only 40% of those who began school 12 years earlier. The other 60% went out into a world of work without even the benefit of a high school education. Of the 40% who graduated, only approximately one-third went on to college. On a national basis, I am told that about 50% of those who enter the first grade remain to graduate and that only about one-third of those go on to college.

These statistics emphasize the opportunity and the challenge we have to prepare high school students for job entry and to prepare dropouts, post-high school students, and adults for jobs or to upgrade their skills in their present jobs.

It is my belief that the vast majority of the schools in our nation offering vocational training have been limited by finances, space, equipment, and trained personnel

to expand and offer the courses demanded by current times. These limitations have made it very difficult for most high schools to provide, in a single school system, a wide variety of courses to qualify students for job skills required by Agriculture, Business, Industry and other occupational fields.

Efforts to find a solution to these limitations led to the development of the Area Center concept. Passage of the Vocational Education Act of 1963, which provided matching funds for construction, gave impetus to the area centers. When I speak of "area centers", I think of two kinds or types of schools. The first is the area school that offers both vocational skills and the basic or academic skills that qualify students for a high school diploma. The other type is the center where students take their basic-education subjects in their home schools and are transported to the area center for vocational instruction and related work experience in the school shops and laboratories. Which type of center better serves the people varies with conditions within the states. The density of population and the distance between schools are, perhaps, the most important factors in making a determination. In my home state students take their basic training in their home schools and are transported to the centrally-located area center for their vocational training and work experience.

The area center does not eliminate previously established courses at the local high school, but serves to expand present offerings by adding new courses and special courses that cannot be economically provided in an individual high school. It is not a device to consolidate all vocational training under one roof or at one location.

The area school offers many advantages over single school programs. The centrally-located center:

I Makes vocational education available to more students.

II Is more economical in that only one facility and one instructional staff is needed, and one set of equipment serves several high schools.

III Provides for a broader curriculum and gives students a wider choice of courses.

IV Provides for more and better vocational guidance.

V Provides for the development of a more flexible vocational curriculum to enable students to receive instruction in other vocational areas which are related to their major fields of interest.

VI The area center, with its new and modern facilities, greatly improves the image and status of Vocational Education and brings pride and prestige to the community and the students by dignifying preparation for occupational life.

Since the passage of the Vocational Education Act of 1963, much has been and is being accomplished in the establishment of area centers throughout the nation. In South Carolina we have fourteen area centers completed and in operation, with eight more under contract and scheduled to be completed by September, 1969. The costs of the 22 schools vary from $400,000 to $1,000,000 each. Projected plans call for 52 schools within the next five years. To date a total of $13,701,186 has been expended and/or earmarked for construction of area centers since the passage of the 1963 Act.

I would now like to leave the high school program and talk about our Technical Education program.

The General Assembly created in 1961 the Advisory Committee for Technical Training, which led to the development of our present State Committee for Technical Education. Initially, this Committee was given two basic missions. To accomodate these responsibilities, two distinct programs were developed: (1) Special Schools, to meet the immediate manpower needs of new and expanding industry, and (2) Technical Education Centers, to assure industry that the State would be able to meet its short-range and long-range needs for middle management technicians.

The flexibility inherent in South Carolina's concept of Technical Education quickly established Special Schools as one of the most effective industrial development tools in the nation. Although this program is custom tailored to meet the needs of each individual industry, Special Schools generally provide full-scale recruitment and specific job training - - at no cost to the manufacturer - - while the new plant or addition is still under construction.

We've trained South Carolinians to become productive workers in virtually every type of industry in every section of the state - - metal working - - food processing - - chemical - - textiles - - candymaking - - and heavy machinery manufacturing.

In addition to the two programs just mentioned, the TEC Mission was broadened in 1961. This was through the assignment to the State Committee of the S.T.E.P. Program by Governor Russell. This is a federally financed program under the Manpower Development and Training Act, and is essentially a literacy program.

The industrial development program, started in South Carolina less than a decade ago, has already produced astounding results for the State and her people. We hear a lot about teamwork, but this industrialization has truly come about as the result of a team effort. TEC is just one part of this team, along with Governmental leadership, the State Board of Education, The State Development Board, Local Development Groups, and interests in the private sector.

The end result of this effort is reflected in the phenomenal growth statistics registered by our State in recent years, and - - more important - - in the bigger paychecks now being taken home by our industrial workers.

TEC's role in this industrialization has been primarily related to the Special Schools program which accomodates new incoming industry on a crash basis. But what about our TEC Centers? What kind of job are they doing?

As I mentioned, TEC Centers are designed to serve the needs of Business and Industry within their particular geographic area. The Centers provide their immediate labor market with highly trained technicians, who fill a critical vacuum in industry between the skilled worker and the professional engineer. In addition, the Centers make their facilities available for special schools training, where applicable, and a wide range of non-degree upgrading and development courses which are offered to meet a particular demand within the community when it arises.

The Centers share with our unique Special Schools a common philosophy: to meet the needs of industry, when and where they exist. In addition, both Special School and TEC Centers are built on the cornerstone of flexibility. They provide what new incoming and expanding industry need when and where it is needed.

In general, a TEC Center is a local institution which makes use of some state funds and whose activities are coordinated - - not dictated - - at the State level. Facilities, curricula, admissions requirements - - all are conceived at the local level, to meet local demands and standards.

There are eleven Centers in operation at this time with one more under construction in the Chesterfield-Marlboro area to go into limited operation in September, 1969. Four more have been proposed to fill the void of such facilities in the southwestern section of the State.

While our State's industrialization effort is conducted on a broad front by many cooperating agencies and groups, TEC's contribution is specific, emphatically demonstrating that South Carolina receives a quick and continuing return on its investment in Technical Education.

If we in the State of South Carolina expect to develop a position of national leadership in the production and distribution of goods and services, we must expand and improve our efforts to develop intelligent, skilled workers. If we hope even to

just maintain our present standards of growth, we must give more attention to technically educating our human resources.

One valuable lesson learned from World War II which must not be forgotten is that our final strength as a Nation, and as a State, in war or in peace, lies in the effective work skills and adaptability of our citizens. If we are to retain our position as a State, proud of our heritage and confident of our destiny, it is imperative that we continue to maintain our ability to produce, and the faculty of adjusting to demands of technological change placed upon our manpower and womanpower.

We can no longer afford to waste any of our South Carolina resources, least of all our human ones.

Occupation oriented education, in the post-high school area, Technical Education is one bulwark of our progress in which South Carolina may place her faith.

I must say that for too long in South Carolina we thought and acted as though every high school graduate must go to college and graduate - - now we know this is not true and never was. We believe that at last we have found a better answer than yesteryears' answer.

All evidence points up the fact that Vocational and Technical Education is the blue-print for economic growth and development in a State or sub-division. There is no substitute that has yet been found. Statewide programs of Vocational Education, and Technical Education, administered through State Boards for Vocational Education and directed by competent State and local personnel with desire, vision and ability and willingness to work, can be the most potent force in the economic growth and development of any State.

*PROJECT COMPUTERIZED VOCATIONAL INFORMATION SYSTEM; PROJECT CVIS; WILLOWBROOK HIGH SCHOOL; VILLA PARK; ILLINOIS

The purpose of this project is: (1) to provide a system by which a student may explore a wide range of occupations with some feedback from his own record of ability, achievement, and interest, (2) to teach a decision making process, (3) to accomplish these goals in an interesting manner, and (4) to assign to the computer the data retrieval and comparison functions it performs best, thus giving human counselors more time to perform the counseling which requires sensitivity and human communication. The sections of the report include theoretical framework, student use of the system, counselor use of the system, student reaction, and system design and programming. Examples of the 400 occupational briefs, computer programs, and scripts which allow students to learn and make decisions about the gateways to careers, military training opportunities, apprenticeships, local jobs, technical and specialized schools, community college occupational curricula, and 4-year colleges are provided. Beginning List of Occupations

Sample Brief

Student-Record Displays

Questionnaire

1. Statement of Goals

It has been our experience in a real-life counseling situation at Willowbrook High School in Villa Park, Illinois, that the dissemination of meaningful information about occupations is our most difficult guidance task. Lack of counselor time, counselor knowledge about occupations, student interest in traditional vocational exploration, and ways to relate data about students to data about occupations are powerful deterrants to the development of relevant vocational guidance programs.

The Willowbrook team which created and designed CVIS has adopted the computer as a tool to help students explore occupations in the light of their own student records. In so doing, the CVIS team has defined the following goals:

1. To provide a system by which a student may explore (not choose) a wide range of occupations with some feedback from his own record of ability, achievement and interest.
2. To teach a decision-making process.
3. To accomplish the preceding goals in a way that is innovative enough to capture student interest.
4. To assign to the computer the data retrieval and comparison functions it performs best and to give human counselors more time to perform the counseling functions which require sensitivity and human communication.

We invite you to help us measure the degree of our success in accomplishing these goals.

II. Summary of Development to Date

The preliminary ideas about CVIS were formulated in the fall of 1966 by three counselors at Willowbrook High School - Miss Lorraine Foster, Vocational Counselor; Mr. Willis Farnham, and Miss JoAnn Harris, Director of Guidance. Later, the school psychologist, Mr. Robert Austin, and the Chairman of the Mathematics Department, Mr. James Boyd, were added to the team.

In December, 1966, the first proposal was submitted to the Research Co-ordinating Unit of the Illinois State Board of Vocational Education and Rehabilitation. The development of the project was outlined in five phases as follows:

Phase I - January-June, 1967

Two members of the team (Harris & Foster) were to investigate all other computer-based guidance projects in the United States and become cognizant of their goals and development. In addition, these two took an introductory course in computer programming in an attempt to understand the computer and its possible application to the guidance field.

Phase II - August, 1967

The five-member team proposed to spend three weeks in a brain-storming mode. The result was to be the theoretical and technical blueprint for Project CVIS, which is summarized later in this report.

Phase III - September, 1967-September, 1968

The purpose of this phase was to make all the preparations necessary for operational phase. The work accomplished in this phase was:

1. Writing of the computer program.

2. Investigation and ordering of appropriate computer equipment.

3. The formation of a computerized student record. This involved joint planning by all pupil personnel workers; the meshing of information from Guidance, registrar, health, reading, deans and psychological files onto one common worksheet; Key-punching of 1800 records; and planning of the format to be displayed on counselor terminals.

4. The securing of 400 occupational briefs. Three hundred-fifty of these were written for the project by the J.G. Ferguson Company (New York and Chicago) free of charge. Fifty were written by the Project Director. All were read, corrected, and key-punched.

5. Writing and testing of scripts.

Phase IV - October 1, 1968-September 30, 1969

This phase is the one in which we are currently engaged. It is the first year of operation with students. The computer equipment was installed in late October. November and December were de-bugging and technical problem months. Smooth operation of the system with both students and counselors began in January. Since January 6, 1969, 531 students have used CVIS on a voluntary basis. Also, during this phase the project team is involved in preliminary evaluation of the system and in massive development (script writing and programming) of the next phase.

Phase V - October 1, 1969-June 30, 1970

This phase will implement the decision-making scripts which

were written in Phase IV. These scripts and programs will allow students to learn and make decisions about all the gateways to careers-military training opportunities, apprenticeships, local jobs, technical and specialized schools, community college occupational curricula, and four-year colleges. This phase will also include the updating of vocational information, further evaluation, and the writing of some computer-assisted instruction courses for vocational education.

The work has been carried out on schedule as proposed in the original proposal. Further, the Board of Vocational Education has continued to support the project, currently at the 75% level, as proposals and reports are submitted one phase at a time.

III. The Theoretical Framework

After consideration of numerous systems of job classification, the Committee decided to use the two-dimensional classification system developed by Dr. Anne Roe, formerly of Harvard Graduate School of Education, and explained in her book, The Psychology of Occupations (John Wiley & Sons:New York, 1956). Roe's classification divided occupations into six levels by amount of training required and degree of responsibility assumed by the worker. Briefly, the six levels are as follows:

Level 1: Professional and Managerial 1. This level requires high-level policy-making decisions and independent, varied responsibilities. If education is a relevant factor, it is at the doctoral level or equivalent.

Level 2: Professional and Managerial 2. The distinction between this level and the above one is one of degree. These jobs may have autonomy, but the responsibility is less than in Level 1. These occupations normally require policy interpretation and education at or above the bachelor level, but below the doctoral.

Level 3: Semi-Professional & Small Business. These jobs have a low degree of responsibility for other people and application of policy or determination for self only. Education is normally high school plus technical school or the equivalent.

Level 4: Skilled. This and the following levels are classic subdivisions. Skilled occupations require apprenticeships or other special training experience.

Level 5: Semi-skilled. These occupations require some training and experience but markedly less than the occupations in Level 4. In addition, there is much less autonomy and initiative permitted in these occupations.

Level 5: Unskilled. These occupations require no special training or education and not much more ability than is needed to follow simple directions and to engage in simple repetitive actions.

Further, Roe divided occupations into eight categories of interest which are to some extent contiguously arranged. The eight interest categories are as follows:

1. Service. These occupations are primarily concerned with serving and attending to the personal tastes, needs, and welfare of other persons. Included are occupations in guidance, social work, domestic and protective services.
2. Business Contact. These occupations are primarily concerned with face-to-face sale of commodities, investments, real estate, and services. Also included are such occupations as demonstrator, auctioneer, and some kinds of agents. A distinction is made in sales occupations between those in which the job is personal persuasion, which belong here, and those in which the selling is routine, and the person-to-person relation relatively unimportant, which belong in the next group.
3. Organization. These are the managerial and white collar jobs in industry, business, and government, the occupations concerned primarily with the organization and efficient functioning of commercial enterprises, and of government activities.
4. Technology. This group includes occupations concerned with the

production, maintenance, and transportation of commodities and utilities. Here are occupations in engineering, crafts (including repair work), and the machine trades, as well as transportation and communication. Whether a physical scientist belongs in this group or in group 6 depends upon the setting in which he is working.

5. Outdoor. This group includes agricultural, fishery, forestry, mining and kindred occupations: the occupations primarily concerned with the cultivation, preservation and gathering of crops, of marine or inland water resources, of forest products, and other natural resources, and with animal husbandry.

6. Science. These are the occupations primarily concerned with scientific theory and its application under specified circumstances, other than technology.

7. General Cultural. These occupations are primarily concerned with the preservation and transmission of the general cultural heritage. The group embraces occupations concerning the subject usually called the humanities in college catalogues, but is broader than these. It includes occupations in education, journalism, jurisprudence, the ministry, linguistics, and so on. All elementary and high school teachers are included in this group. At higher levels teachers of science and art are placed in Groups 6 and 8.

8. Arts & Entertainment. These occupations include those primarily concerned with the use of special skills in the creative arts and in the field of entertainment. Both creators and performers are included.

At the time Roe published her book, she classified approximately 350 occupations in this way. In 1966, Dr. Roe and her associates at

Harvard reworked the list of occupations in accordance with the new Dictionary of Occupational Titles, and the new list consists of 650 occupations. An example of the classification system follows:

Level	Service	Business Contact	Organ-ization	Tech-nology	Outdoor	Science	General Cultural	Arts & Entertain-ment
I	Psychia-trist					Anthro-pologist	Lawyer	Architect
II	Social Worker	Public Relations Worker	Hospital Admini-strator	Airplane Pilot	Surveyor	Nurse,RN	Teacher	Actor
III	Police Chief	Sales Auto	Steno-grapher	Drafts-man	Forest Ranger	Dental Hygienist	Radio Announcer	Photo-grapher
IV	Practical Nurses	Driver Salesman	Book-keeper	Jeweler	Miner	Optician		Letterer
V	Waiter		Typist	Truck Driver	Chainman			
VI	Orderly		Mail Machine Operator	Cement Mason	Lumber-jack			Pinboy

Given this two-dimensional classification system, the Willowbrook Committee began to study the ways in which objective data available about every student could be related to it. It was decided to put student permanent records in computer storage, so that parts of the record can be used in helping a student make realistic vocational choices. In beginning operation, the committee decided to make use of cumulative class rank, composite score on a battery of tests, and an interest inventory, possibly the Kuder Preference Record. After data are gathered over years of experience, other items on the student record, such as grades in specific courses and personality ratings, may be used. The battery of tests which will be administered to sophomores yields a verbal and non-verbal ability score and six achievement scores

(Mathematics, Science, Reading, English, Social Studies, Solving Everyday Problems). The relationship of data to Roe's six levels will be as follows:

Cumulative Rank in Class									Composite Test Battery Score %
Top-One Quarter	1								Top Quartile 76-99%
1st-2nd Quarter	11								1st-2nd Quartile 51-99%
2nd-3rd Quarter	111								2nd-3rd Quartile 26-75%
2nd-3rd Quarter	1V								2nd-3rd Quartile 26-75%
3rd Quarter	V								3rd Quartile 26-50%
4th Quarter	VI								4th Quartile 1- 25%
KUDER		SOCIAL SERVICE	PERSUA -SIVE	CLER. COMPU- TATION	SCIENCE MECH. COMPU.	OUT- DOOR	SCIEN- TIFIC	LITER- ARY	ARTISTIC MUSIC LITERARY

The computer is instructed to use the higher of the two criteria (rank or composite score) for its reactions, which will be explained later, in case of discrepancy. Should the test score be considerably higher than the rank in class, the computer will call this to the attention of the student.

IV. The Student Use of the System

Any student who wants to use the computer terminals may do so by scheduling an appointment with Mrs. Morgan, our full-time CVIS secretary. Students may come in person to set an appointment or may fill out a department form called "Request to see Counselor." Student response has been very enthusiastic. In spite of using three terminals on an eight-hour day, we are currently booked solid for the next five weeks.

The first time the student comes to the system, he goes through the entire script as included in the appendix. The second time he comes to the system, he receives the message "Hi, John Jones, the last time you were exploring occupations in the field of technology that require technical school training. In case you've forgotten, here's that list again (appears on screen). What would you like to do today?" From this point, the student may continue with that list, recall new lists by choosing different areas of interest and/ or different educational plans, or recall the occupational briefs of any occupation which he may select from an alphabetical list. For your information in this report, we have included in the appendix a list of our 400 occupations by Roe category, and a sample occupational brief.

In addition to voluntary use of the system by any Willowbrook student, its use is being interwoven with a three-week vocational unit in the sophomore English curriculium. Our vocational counselor, Al Cocks, gives a general introduction to vocational exploration at the beginning of the English unit. He also administers and interprets the Kuder Preference Record. Next, he shows a 10-minute

tape-film presentation which has been developed by Willowbrook counselors to explain Roe interest categories by showing a sampling of jobs in our community which fall in each category. Then the CVIS secretary schedules all members of the class for use of the computer terminals. Finally, the class goes to the library, so that each student can explore an occupation of his choice in depth by use of resource material, and write a paper about it.

Next fall Willowbrook students will be able to get computer assisted instruction, make decisions and get information about military vocational training programs, entry jobs in DuPage County, technical and specialized schools within a 50-mile radius, local apprenticeships, the occupational curricula at the local College of DuPage and others, and 450 four-year institutions.

V. The Counselor Use of the System

Each of Willowbrook's twelve full-time counselors has an IBM 2260 display terminal in his office. On this terminal he can recall the student record of any one of his counselees. These displays are illustrated in the appendix. We have found that this capibility is not only time-saving to the counselor, but much more effective with the student. The test information display seems to do a much more adequate job with the student than any paper interpretation.

We have just added the records of our incoming Freshman class. The counselors are now holding half-hour interviews with each of our 900 incoming Freshmen and their parents. The personal data section is recalled during the interview for verification by the parents. Correction can be made by the counselor on-line. Next the test information frame is recalled for interpretation to student and parent. The third frame available now is "Recommendations for Sectioning". Here the counselor finds the computer recommendation for the selection of a Freshman Math course, Science course and English sectioning. These recommendations are possible because these three departments have outlined the selection variables based on past experience and follow-up. The programmer has written a program which instructs the computer to look at the appropriate sections of the test battery (ability score, Math achievement, and battery composite for Math) and the 8th grade teacher recommendation, to assign priority to the variables, and to make a recommendation.

In addition to student records, the counselor can recall any

one of the 400 occupational briefs on the screen by typing in JOB 101, for example. In this way he can discuss job duties, training requirements, employment outlook, etc. with a student in an interview situation.

Next year the counselor will also be able to recall information about all the kinds of training opportunities stored in the system.

VI. Student Reaction to CVIS.

We have enclosed here a copy of the questionnaire which each student is invited to fill out after using the computer system. Also enclosed on the following page is a tally sheet of the questionnaires which we have to date. Although this summary will capture the general highly positive attitude of the students, the real proof of acceptance is watching and listening to the student users.

They are saying some unexpected things, too. For example, it is easier to find out that you are in the 3rd or 4th quarter by ability or achievement from a machine than from a human. Second, the computer could care less about which occupations the student chooses to explore while human counselors make value judgments, or at least the kids think they do. A pretty girl said, "I wanted to read about being a nun. The computer didn't care, but my counselor would have laughed at me." A third reaction is that they want to "talk or type back to <u>him</u>." Our script has apparently succeeded in giving the computer a degree of human personality, which oddly enough is masculine in spite of its feminine unpredictability in the opening weeks of operation.

VII. System Design and Programming.

Here's a brief summary of the hardware we have:

At the College of DuPage (Naperville, Illinois, 15 miles away)

1 - 2030 360 Model 30 - 65K

2 - 2311 Files

1 - 2841 File Control

1 - 2701 for teleprocessing

1 - 1403 Printer

1 - 2540 Reader & Punch

1 - 2821 Reader Punch Printer Control

At Willowbrook High School

1 - 2848 Display Control Unit

1 - 1053 Typewriter Printer

14 - 2260 Cathode ray tubes

The Willowbrook equipment is connected to the computer by means of a private, high grade phone line with a data set at each end of the line.

The CVIS program is written in Basic Assembly Language in order to save space in core. The remote relay is controlled by another program which is written in B-Tam. These programs occupy 24K positions of core storage and operate in the foreground of the computer. Willowbrook is on-line from 7:30 A.M. until 10:00 P.M. five days per week.

Counselors use the system during the evening for 8th grade interviews, and the College of DuPage students are invited to use the Willowbrook equipment during this time.

Plans are being laid to invite high school students from all over the County to use the CVIS system during the summer months.

Project for the Computerization of Vocational Information
Beginning Script - October 1968

Hello. Please type in your student number and press the EOB key.

O.K. I think I've got your number. Is this right 456-123-789? If so, please press EOB. If not, please re-type your number.

1. (If first number was not correct) I now have your number recorded as _____. If this is right, press EOB. If not re-type your number and press EOB.
2. (If number is still incorrect) Since I am having difficulty getting your number right, please see the attendant.
3. I do not find your record in my memory, so we've got a problem. Please see the attendant.

Hi! Mary Swanson. That is your name isn't it? If yes, press EOB. If not, we've got problems. Type SOS and request help from the person in charge of the room.

By now you've learned that I'm not very sensitive about human relations. The only way that I know that you're ready for me to reply to you is for you to press the EOB key.

Welcome to CVIS. That stands for Computerized Vocational Information System. I'm an automated library of information about jobs. I have information stored in my memory about 400 jobs.

The information in my memory has been arranged in several ways - by area of interest, by amount of training required for the job, by job title.

You may decide what information you would like to look at. Since one of my best qualities is speed, I'll get any information you want very quickly.

In order to help guide you in your search for jobs, I've also made a mental note of all your semester grades since you entered high school and the results of ability & achievement tests which you have taken.

Ability, achievement and grades may or may not predict future success on the job, but they are the best things we now have to help you make selections.

Before we go to work I'd like to challenge you to a game of tic-tac-toe. I'll let you decide whether you want to move first or not.

1. I'll move first
2. I'll let CVIS move first
3. I don't want to play

(If student wants to play) Make your move by typing in the number of the "box" where you want to place your mark.

LOST - Maybe you'd like to try again at another time. Here's my record of wins. I'm so good at the game because I practice while you're out on dates.

WIN - Congratulations! You beat me! I want to show you my record though. I'm pretty good at the game. I practice while you're out on dates.

TIE - So, we've tied. Maybe we'll have a chance to play this off another day. Look at my total score.

We'd better get to work. You know how school is .....

Since there is probably a relationship between occupational level and your success as a learner, let's begin by looking at your school learning ability. We've tried to measure this by tests.

Try to remember how you did on the last tests you took. If you can't remember, I'll help you.

How do you think you did compared to students of your grade level in the nation?

1. Top Quarter
2. Second quarter
3. Third quarter
4. Bottom quarter

O.K. message - Good Show! You've got a good memory.

HIGH - Whoops! the last test placed you in the ..... quarter. You may want to check this out with a counselor.

LOW - No, you're in the ..... quarter. It's easy to under-rate yourself. Feel free to discuss this with a counselor.

We know that high school grades do well in predicting your success in further schooling. We really don't know how well they relate to your success on the job.

Try to think where you fit in your whole class based on your grade average at the end of last semester. Think about your semester grades in all your courses. Try to figure an average.

Now which quarter of the class do you think you'd be in?

1. Top quarter
2. Second quarter
3. Third quarter
4. Bottom quarter

O.K. - you're right. You may ask a counselor for your exact grade point average and rank if you'd like to.

HIGH - Maybe you forgot about some of your semester grades. Actually you are in the ..... quarter of your class. Talk this over with your counselor if you'd like to.

LOW - I have a pleasant surprise for you. You're in the ..... quarter.

Next we should think about your plans after high school. These plans will have a very definite relationship to the kind of job that you can get.

Keeping in mind what we have just reviewed about your school ability and achievement select the amount of education and job training you are planning immediately after high school.

Later of course, you may decide to continue your education. But for now just think of your initial plans and type the number of your choice from the list that follows.

1. No further training after high school
2. Some training on the job (2-6months)
3. Trade school or apprenticeship.
4. Junior College (2 years) or technical school (6-18months)
5. Four years of college.
6. Advanced degrees after college (PhD.orMD.)

(If test information and grades agree or if grades are the higher of the two)

The plan you have chosen seems fine.

(If test scores are higher than grades)

This plan seems fine based on your ability as measured by tests. At this time your grades are not as high as your ability predicts they could be.

OR

Your high school record indicates that you could successfully complete more education. Let's go ahead and look at the jobs available with this kind of training. You may want to dicuss this with a counselor.

OR

That's not going to be easy for you considering your grades this far. Your choice of school will be important. You may want to discuss this with a counselor. Let's go ahead and see what kind of occupations there are with this kind of training.

OR

Your choice puzzles me somewhat. I've compared it with your high school record, and the two don't seem to match. The best way to clear up this problem would be to see a counselor.

You may decide what you'd like to do. Just type in the number of your choice (only applies to the previous message)

1. Continue with this plan of education.
2. Sign off and see a counselor.
3. See the list of educational plans again.

Work can be fun if it's interesting to you. The occupations in my memory are divided into 8 broad areas of interest. I'm going to give you a brief description of each area. Then I'll give you the whole list again and ask you to choose one interest area which you wish to explore.

1. Service - People in these occupations help other people or serve their personal needs. Examples are beauty operator, policemen , social worker, counselor and psychologist.

2. Business Contact - People in these jobs sell products or services by face to face contact with other people. This includes real estate, stocks & bonds, services and all kinds of products.

3. Organization - These are the "white collar" jobs in business, industry, and government. They are typically "desk jobs" which are necessary for the smooth running of business and government activities. Examples are hotel manager, stenographer, typist, and certified public accountant.

4. Technology - People in these jobs are concerned with the production, maintenance, and transportation of goods and utilities. They are often those who put scientific theory into action and like to work with things rather than people. Engineers, pilots, electricians, plumbers, computer programmers are included in this group.

5. Outdoor - People who work outside are included in this group. They include forest rangers, surveyors, landscape architects, construction workers and farmers.

6. Science - People in these occupations do scientific research, develop scientific theory and apply it. This group includes all the health careers. Other examples are chemists, biologists, dental hygenists, and X-ray technicians.

7. General Cultural - People in these occupations attempt to pass on to others the culture of our society. These occupations are related to the kind of subject matter called "Humanities" Examples are elementary school teachers, high school teachers, lawyers, ministers and journalists.

8. Arts & Entertainment- This group includes the performing artists, such as actors, T.V. performers and musicians. It also includes artistic occupations such as architects, interior decorator and photographers.

Now I'll show you the list again.

1. Service
2. Business Contact
3. Organization
4. Technology
5. Outdoor
6. Science
7. General Cultural
8. Arts & Entertainment

Please choose one that you would like to explore and type in the number.

You showed significant interest in this field on the last interest inventory you took

OR

This is a new area of interest for you. The interest inventory which you recently took showed interest in .....go ahead and explore this new one.

Now I'm ready to give you a list of suggested jobs to explore. I'm going to type these for you so that you can keep the list. I can only type at 180 wpm so please be patient with me.

I'll tell you more about any or all of the occupations on this list, or, if you don't see any jobs that you are interested in, you can get a new list by changing your choice of interest area and/or amount of education beyond high school.

Your wish is my command:

1. I would like to find out more about some occupations on this list.
2. I want to receive a new list in this category.
3. I want to make new decisions about education and/or interest and receive a new list.
4. I want to sign off.

Please type in the number of your choice.

(If number 1) - Just type in the number of the occupation on the list which you wish to explore.

I'm going to give you a short definition of this job first.

Now do you want to know more about this job, or do you want to choose another job on your list?

1. I want more information
2. I want to choose another job on the list.
3. I want to make new decisions and receive a new list.
4. I want a new list in this category of interest and education.
5. I want to sign off.

Please type in the number of your choice.

(If number 1) O.K. I'm going to type this for you so that you may keep it.

You may tear off what I have just typed for you and take it home with you. If you want more information, check the vocational resource room.

I am interested in your reaction to this occupation.

What did you like about it? You may type in as many answers as you like:

1. The things I would do on the job.
2. The amount of training required for the job.
3. The salary.
4. The future of the occupation.
5. The kind of life I would have in this occupation.
6. The kind of people I would meet.

What did you dislke about this occupation? You may type in as many answers as you wish:

1. The things I would do on the job.
2. The amount of training required for the job.
3. The salary.
4. The future of the occupation.
5. The kind of life I would have in this occupation.
6. The kind of people I would meet.

SECOND TIME ON SYSTEM

You liked me well enough to come back again,huh! Good. The last time you had me chasing occupations in the interest category of ..... with..... level of training. In case you've forgotten, here's that list again.

You may continue with this list, get a new one, or explore individual occupations. Which one would you like to do?

THIRD TIME ON THE SYSTEM

So this is your 3rd trip! I'm glad you find me useful. What would you like to do today?

1. Look at your list again.
2. Get a new list of occupations.
3. Choose any occupation from my 400.

MAINTENANCE ELECTRICIANS

MAINTENANCE ELECTRICIANS MAINTAIN AND KEEP MANY DIFFERENT TYPES OF ELECTRICAL EQUIPMENT IN GOOD WORKING ORDER PRINCIPALLY BY DETECTING AND REPAIRING DEFECTIVE EQUIPMENT BEFORE A BREAKDOWN OCCURS.

MANY WORK IN MANUFACTURING PLANTS, ESPECIALLY OF TRANSPORTAION EQUIPMENT, CHEMICAL AND ALLIED PRODUCTS, AND NONELECTRICAL MACHINERY. OTHERS WORK IN COMMUNICATIONS, PUBLIC UTILITIES, MINES, AND WHOLESALE AND RETAIL TRADE ESTABLISHMENTS.

THE MAINTENANCE ELECTRICIAN MAY READ BLUEPRINTS OF WIRING, MAKE MATHEMATICAL CALCULATIONS, AND SPLICE, SOLDER, BUT, BEND, MEASURE, AND INSTALL WIRE AND CONDUIT. HE MAY REPAIR OR REPLACE WIRING, FUSES, TRANSFORMERS, COILS, OR SWITCHES. HE USES PLIERS, WRENCHES, SCREW-DRIVERS, KNIFE, DRILLS, AND OTHER HAND TOOLS FOR INSTALLATION AND REPAIR WORK; AND TEST LAMPS, AMMETERS, VOLT-OHM METERS, AND OSCILLO-SCOPES TO TEST EQUIPMENT.

A PROSPECTIVE MAINTENANCE ELECTRICIAN NEEDS GOOD HEALTH, COLOR VISION, MANUAL DEXTERITY, AND MECHANICAL APTITUDES. HE SHOULD HAVE A KEEN SENSE OF RESPONSIBILITY AND BE SELF-RELIANT. AT LEAST A HIGH SCHOOL EDUCATION IS NECESSARY, INCLUDING SUCH COURSES AS ALGEBRA, TRIGONOMETRY, PHYSICS, ELECTRICITY, AND SCIENCE. ABILITY TO READ BLUEPRINTS IS IMPORTANT. BECAUSE ELECTRICAL WORK IS CHANGING, IT IS ALSO IMPORTANT THAT THE MAINTENANCE ELECTRICIAN ACQUIRE ADDITIONAL FORMAL TRAINING FROM TIME TO TIME.

OFTEN THIS ELECTRICIAN NEEDS TO KNOW LOCAL BUILDING CODES, AND WHERE A LICENSE IS REQUIRED, IT CAN BE OBTAINED BY PASSING A COMPREHENSIVE EXAMINATION.

MOST MAINTENANCE ELECTRICIANS APPLY FOR APPRECTICESHIPS THROUGH THE UNION OR THROUGH THEIR EMPLOYER, BUT IT IS DIFFICULT TO GET ACCEPTED INTO THIS PROGRAM AS THE NUMBER OF APPRECTICES ARE LIMITED TO A PROPORTION OF THE NUMBER OF JOURNEYMEN EMPLOYED BY A UNION SHOP.

ADVANCEMENT DEPENDS TO A LARGE DEGREE ON OPENINGS AND ON SENIORITY IN THE UNION.. THEY MAY ADVANCE TO CONSTRUCTION ELECTRICIAN, FOREMAN, OR PLANT MAINTENANCE SUPERINTENDENT.

THERE IS AN INCREASE IN JOBS EXPECTED IN THIS FIELD DURING THE NEXT DECADE DUE PRIMARILY TO THE EXPECTED INCREASE IN IDUSTRIAL ACTIVITY, THE NUMBER OF NEW HOMES TO BE BUILT, AND THE CONTINUAL INCREASE IN ELECTRICAL DEVICES. MANY NEW JOBS WILL OCCUR IN THE PRIMARY METAL, FABRICATED METAL, MACHINERY, AND CHEMICAL INDUSTRIES.

THE HOURLY WAGE FOR MAINTENANCE ELECTRICIANS IN A SURVEY OF 77 CITIES IN 1964 RANGED FROM $2.07 TO $3.63. APPRENTICES START AT ABOUT 60 PERCENT OF THE JOURNEYMANS WAGE.

A MAINTENANCE ELECTRICIAN SPENDS MOST OF HIS 40 HOUR WORKWEEK INSIDE, IN A VARIETY OF CONDITIONS SUCH AS A CLEAN, CARPETED OFFICE, OR A NOISY, DRAFTY INDUSTRIAL PLANT. THE WORK MAY INCLUDE CLIMBING LADDERS, WORKING IN CRAMPED QUARTERS, OR IN SPACIOUS COMFORTABLE SURROUNDINGS. THIS ELECTRICIAN MAY WORK AT NIGHT OR OVER WEEKENDS, BUT OVERALL HE IS LESS AFFECTED BY SEASONAL WORK THAN THE CONSTRUCTION ELECTRICIAN.

THE WORK OF THE MAINTENANCE ELECTRICIAN IS NOT CONSIDERED A ROUTINE JOB. HE WILL NOT USUALLY WORK IN ANY ONE LOCATION FOR ANY LENGTH OF TIME, AND WILL COME IN CONTACT WITH A VARIETY OF PEOPLE WORKING IN DIFFERENT CAPACITIES IN HIS PLACE OF EMPLOYMENT.

WILLOWBROOK HIGH SCHOOL
GUIDANCE DEPARTMENT

The following questions are being asked in order to find out how valuable Project CVIS has been to you and to help us improve it for you and others. We appreciate your time in answering these questions:

1. Did you learn anything about yourself from using the computer?

   Yes 63% No 22% Don't Know 15% If yes, please explain _____

   _____

2. Did you learn anything new about occupations? Yes 68.7% No 17%

   Don't Know 14.3% If Yes, please explain _____

   _____

3. If you received a list of occupations today, did it give you some new ideas which you had not had before? Yes 46.8% No 42.6% Don't Know 10.6%
   If Yes, please explain _____

4. Will you explore these further? Yes 77.5% No 11.6% Don't Know 10.9%

   How? Counselor 22.2% Computer 30.8% Vocational Library 33.3%
   Other 13.7%

   Please explain _____

5. What was your reaction to "machine counseling" _____

   Student reaction to Question 5:
   Exciting, Neat, Cool, Real Great, Fun, Enjoyable - 100
   Friendly - 2
   Amazing, outstanding, Hard to Believe-7
   Lots of good information - 11
   Confusing - 2
   O.K. or Pretty good - 9
   Not impressed - 1
   Accurate & Objective - 2

   What did you like about it? :
   Everything - 8
   Good, accurate information - 52
   Interesting & different - 18
   Fun - 5
   Speed & Ease - 34
   Helped me make a decision - 5
   Mechanical perfection - 2

5. What did you like about it? : It knows a lot - 4
The way it talks - 11
Friendliness, knows my name - 3
I can control it - 2
It's honest - 1
It knows my capabilities - 1

5. What did you dislike about it? : Nothing - 96
Record not stored - 4
Not enough information about occupations - 6
Machine too slow - 1
Machine too fast - 2
Did not have desired occupations - 5
Student didn't have enough time - 4
Operation was complicated - 4
Machine won at Tic-Tac-Toe - 4
Machine gets mixed up - 2
Machine did not make a choice for student - 1

6. Were you locking for some occupations which you did not find in our beginning selections? Yes 26% No 74% If yes, which ones _____

_____

7. Was the "conversation" with the computer interesting? Yes 97.3% No 2.7%

Do you have some suggestions for improving it? _____

_____

8. Were the occupational briefs informative? Yes 96% No 4%
Were they interestingly written? Yes 97.8% No 2.2%
Do you have any suggestions for improving the occupational briefs?

_____

_____

9. What could we do to make this experience more helpful to you? _____

_____

_____

10. Please make any comment about today's use of the computer which would help us know how you feel about CVIS. _____

_____

_____

_____

Student reaction to Question 10:

" CVIS is a new and unique experience, and will be helpful to every student".

"I think this service is great! It gives you information in a "fun" sort of way".

"I think it is great, and maybe in the future itwill be in every school".

"The computer is an unfortunate by-product of our age. We have to live with it, maybe even like it".

"I'm glad there is a computer like CVIS that can give us an idea about our future".

"This is one of the best ways a school can help a student find out what he can be. It tells him what requirements are necessary, which I feel the student wants to know first".

"I thought it was a real experience. I have never done anything of the kind before and it has helped me quite a bit".

"It is quick, students don't have much other time".

"Unfortunately it's impersonal, but it is probably more exact, and unbiased toward the individual".

"He is very helpful and useful, and I think that they should get one in every school to help out other students as well as Willowbrook's".

1969

The National Association of Industrial
and Technical Teacher Educators

CONSTITUTION AND BY-LAWS

Article I. Name, Affiliation, and Meetings.

Section 1. This professional group shall be known as the National Association of Industrial and Technical Teacher Educators.

Section 2. It shall exist under affiliation with the Industrial Arts Division and Trade and Industrial Division of the American Vocational Association, Inc., and shall hold its major annual meeting in connection with the annual convention of that Association.

Section 3. Other meetings may be called by the President and shall be called by him upon petition signed by twenty members of the Association.

Article II. Aims or Purposes.

Section 1. This Association shall earnestly endeavor:

a. To bring about closer cooperation among those engaged in preparing and improving teachers and other workers in health occupations, industrial arts, technical education, and trade and industrial education;

b. To stimulate and to take appropriate action concerning practices and proposals in industrial and technical teacher education and in other educational phases related thereto;

c. To increase the contribution of the group to the extension and perfection of all phases of industrial arts and vocational and technical education;

d. To foster research and recording of experiences in line with professional interests;

e. To promote other common desires of the group.

Article III. Membership

Section 1. Eligibility for membership shall be assumed to embrace all persons interested in the problems relating to the preparation of teachers for health occupations, industrial arts, technical education, and trade and industrial education.

Section 2. There shall be only two types of memberships: active and honorary.

Section 3. An active member is a member whose dues in the Association are paid to date.

Section 4. Honorary Membership.

a. Honorary members must:

(1) Be nominated by an active member. The nomination must be presented to the Secretary in writing. Recommendations including detailed specifics concerning the achievements of individuals nominated for honorary life membership are the responsibility of the individual or group making the nomination. The application deadline is two months prior to the annual meeting. Individuals to be honored will be notified.

(2) Be approved for honorary membership by a majority of the Executive Committee.

b. Nominees for honorary membership shall be drawn from three categories of persons:

(1) Industrial and technical teacher educators who have retired by reason of age or disability or who have at least twenty-five (25) years of service in this field, and have:

(a) Made significant contributions to this organization.

(b) Been paid active members during the last ten years of their careers. Individuals who enter the profession late in life (generally after 55 years of age) are exempted from this criterion. Failure to comply

with this criterion due to illness, foreign service or other extenuating circumstances will not operate against a person who is recommended.

(2) Other industrial and technical teacher educators who have made contributions which are clearly outstanding, such as:

(a) Promotion to positions of distinction which lend prestige and direction to industrial and technical teacher education, as a college presidency, vice presidency, deanship or similar office.

(b) Successful completion of research projects which are of monumental value to the field.

(3) Those persons outside the field of industrial and technical teacher education who have made contributions of outstanding value to the organization and its efforts.

Article IV. Dues and Assessments

Section 1. Membership dues or assessments shall be fixed by the Executive Committee except when the Association, at an annual meeting, shall act in these matters. There shall be no dues or assessments required of honorary members.

Section 2. Only members whose current and past dues and assessments have been paid in full shall be eligible for election to office or appointment to committee.

Article V. Officers and Committees.

Section 1. The officers shall consist of:

* president
* four vice-presidents (two from industrial arts education; two from trade and industrial and technical education)
* editor JITE
* secretary-treasurer
* three trustees

Section 2. The three trustees shall act as an Auditing Committee.

Section 3. There shall be such standing committees as may be designated in the By-Laws or authorized at an annual meeting and such special committees as may be appointed by the President.

Section 4. The office of secretary-treasurer shall be continuous.

Article VI. Amendments

Section 1. Any member may propose amendment to this Constitution or to its By-Laws at any annual meeting. There need be no advance notice of such intention. The proposal shall be read and submitted in writing, signed by the member.

Section 2. A two-thirds vote of members present shall be necessary for amendments. Twenty members shall be the minimum number present and voting.

By-Laws

Item 1. Election of Officers.

Officers shall be elected by a majority vote at the annual meeting, and they shall serve until their successors have been duly chosen.

Item 2. Election of Trustees.

One trustee shall be elected each year for a three-year term, by majority vote, at the annual meeting.

Item 3. Nominating of Officers and Trustees.

The President shall appoint a nominating committee of three at the opening of each annual meeting. This committee shall offer one person in nomination for each vacancy. Other nominations may be made from the floor at the business session before the vote.

Item 4. Duties of Officers.

Officers shall perform the usual duties and have the customary powers, respectively.

Item 5. Vacancies.

In case the President is absent from any meeting or unable to complete his term, the

other members of the Executive Committee shall request one of the vice-presidents to serve as president. Other offices which may become vacant shall so remain until the next election, and the President shall assume or delegate the duties and powers interrupted. In case the office of president becomes vacant, the position shall be filled by a vice-president chosen by vote of the Executive Committee.

Item 6. Ex Officio Service.

The President shall be, ex officio, a member of all standing or special committees, except the Nominating Committee, with power to vote. He shall not serve as chairman.

Item 7. Committee Reports.

Chairman of all committees shall make their own reports to the annual meeting and shall file such reports with the secretary-treasurer.

Item 8. Rules of Order.

Roberts' Rules of Order shall be in effect, except as the Association may otherwise direct.

Item 9. American Vocational Association Advisory Council representative.

The President shall each year appoint two members to serve as representative and alternate, respectively, to the American Vocational Association Advisory Council. One of the representatives shall be the Immediate Past President.

Item 10. Term of Office.

The terms of office for the President and the Vice-Presidents shall be one year and two years, respectively.

Item 11. Executive Committee.

The elected officers and trustees, the Immediate Past President and editor of the Journal, shall constitute the Executive Committee of the Association and shall meet immediately following the annual meeting during the AVA Convention. In addition to the duties stated and implied in the Constitution and By-Laws, they shall plan the program and determine policies for the ensuing year, review present projects, and approve or

reject new projects of the Association. They shall prepare plans to implement all projects undertaken by the Association.

Item 12. Fiscal Year.

The fiscal year of the Association shall be established as starting November 15 and ending November 14 of the following year.

Item 13. The Industrial Arts Policy and Planning Committee and the Trade and Industrial Education Policy and Planning Committee Representatives.

When a vacancy is anticipated, the nominating committee shall offer one person in nomination and one person as an alternate to serve as representative to the Policy and Planning Committee. The appointment shall be for a term of three years.

Item 14. The Vocational Industrial Clubs of America Advisory Council Representatives.

When a vacancy is anticipated, the nominating committee shall offer one person in nomination from trade and industrial education and one person as an alternate from trade and industrial education to serve as representative to the Vocational Industrial Clubs of America Advisory Council. The appointment shall be for a term of one year.

Item 15. AVA Council on Teacher Education Representatives.

Through the AVA Council on Teacher Education, the Association shall be affiliated with the Associated Organizations of Teacher Education. Four representatives (two from industrial arts education and two from trade and industrial and technical education shall represent the Association on the AVA Council on Teacher Education. When a vacancy occurs, the President shall appoint the replacement. The appointment shall be for a term of four years.

The National Association of Industrial Teacher Educators

OFFICERS (1937-1968)

President— 1937
George E. Myers, University of Michigan

Vice Presidents—
Robert W. Selvidge, University of Missouri
Oakley W. Furney, Asst. Commissioner for Vocational Education, New York State Education Department, Albany

Sec.-Treas.—
Homer J. Smith, University of Minnesota

Trustees—
Russell L. Greenley, Purdue University
V. P. McKinley, University of Alabama
Lynn E. Stockwell, University of California

President— 1938
George E. Myers, University of Michigan

Vice President—
V. P. McKinley, University of Alabama
Lynn E. Stockwell, University of California

Sec.-Tres.—
Homer J. Smith, University of Minnesota

Trustees—
Laura Murray, University of Texas
F. Theodore Struck, The Pennsylvania State College
Arthur B. Mays, University of Illinois

President— 1939
V. P. McKinley, University of Alabama

Vice Presidents—
David F. Jackey, University of California
Verne C. Fryklund, Wayne State University
E. L. Williams, Texas A. & M. College

Sec.-Treas.—
Homer J. Smith, University of Minnesota

Trustees—
A. B. Mays, University of Illinois
F. Theodore Struck, The Pennsylvania State College
Helen Livingstone, New York State Education Department

President— 1940
Verne C. Fryklund, Wayne State University

Vice Presidents—
Kenneth C. Beach, Louisiana State University
Lynn A. Emerson, Cornell University
Mack Stoker, University of California

Sec.-Treas.—
E. L. Williams, Texas A. & M. College

Trustees—
George B. Cox, Oregon State College
Helen Livingstone, New York State Education Department
A. B. Mays, University of Illinois

President— **1941**
F. Theodore Struck, The Pennsylvania State College

Vice Presidents—
Lawrence F. Ashley, Director of Vocational Education, Yonkers, New York
Thomas Diamond, University of Michigan
George B. Cox, Oregon State College

Sec.-Treas.—
E. L. Williams, Texas A. & M. College

Trustees—
Helen Livingston, New York State Education Department
Clyde A. Bowman, Stout Institute
Anthony M. Goldberger, University of Pittsburgh

President— **1942**
Lynn A. Emerson, Cornell University

Vice Presidents—
Clyde Wilson, University of Tennessee
C. L. Wetzel, St. Louis Board of Education
Herbert Sotzin, San Jose State Teachers College

Sec.-Treas.—
Charles Cyrus, University of Texas

Trustees—
Cleo Murtland, University of Michigan
Helen Livingston, New York State Education Department
Clyde A. Bowman, The Stout Institute

President— **1943**
Clyde H. Wilson, University of Tennessee

Vice Presidents—
E. E. Erickson, Santa Barbara, California
Gilbert Weaver, New York State Education Department
Harold Silvius, Wayne State University

Sec.-Treas.—
Walter B. Jones, University of Pennsylvania

Trustees—
U. G. Whiffen, Washington State College
Clyde A. Bowman, Stout Institute
Cleo Murtland, University of Michigan

President— **1944**

Gilbert Weaver, New York State Education Department

Vice Presidents—

Charles Crumpton, University of Kentucky
Harry Paine, University of Cincinnati
Felix Averill, New York State Education Department

Sec.-Treas.—

Walter B. Jones, University of Pennsylvania

Trustees—

Laura Murray, University of Texas
U. G. Whiffen, Washington State College
Clyde A. Bowman, The Stout Institute

President— **1945**

Walter B. Jones, University of Pennsylvania

Vice Presidents—

Edward L. Williams, Texas A. & M.
Raymond W. Phipps, Teachers College of Connecticut
E. C. Jeppsen, Utah State Agricultural College

Sec.-Treas.—

S. Lewis Land, The Pennsylvania State College

Trustees—

U. G. Whiffen, Washington State College
Clyde A. Bowman, The Stout Institute
G. Harold Silvius, Wayne State University

President— **1946**

S. Lewis Land, The Pennsylvania State College

Vice Presidents—

David Jackey, University of California
Merritt W. Haynes, Teacher Trainer for Trade and Industrial Education, Georgia
Herb Heilig, Colorado A. & M. College

Sec.-Treas.—

Thomas Diamond, University of Michigan

Trustees—

Clyde A. Bowman, The Stout Institute
G. Harold Silvius, Wayne State University
E. L. Williams, Texas A. & M. College

President— **1947**

E. L. Williams, Texas A. & M. College

Vice Presidents—

Clyde Bowman, The Stout Institute
Merritt W. Haynes, Teacher Trainer for Trade and Industrial Education, Georgia
Melvin Barlow, University of California, L. A.

Sec.-Treas.—

Thomas Diamond, University of Michigan

Trustees–
Eugene Fink, New York State Education Department
Charles Crumpton, University of Kentucky

President– **1948**
G. Harold Silvius, Wayne State University

TO: Members of the National Association of Industrial and Technical Teacher Educators

FROM: W. R. Miller, Secretary-Treasurer

RE: Information of Interest to NAITTE Members

For a number of years your organization has supported a plan whereby all NAITTE members are informed of the business matters that take place at the annual convention.

The results of executive committee action are especially significant since the officers are functioning in your behalf and this is your only opportunity to be informed about their actions.

The contents of this packet are most helpful to those of us who may not be able to attend the convention at all, or who have conflicts and find it necessary to miss one or more NAITTE sessions.

The following items, in the order listed, are included:

1. NAITTE Constitution and By-Laws: Directory of Officers

2. Minutes of the First Executive Committee Meeting
   Minutes of the First General Session and Business Meeting
   Minutes of the Second General Session and Business Meeting
   Minutes of the Second Executive Committee Meeting
   Minutes of the Third Executive Committee Meeting

3. Report of the Treasurer for the Fiscal Period November 15, 1967 - November 14, 1968.

4. Industrial Arts Policy and Planning Committee Summary Report - Mr. Lowell Carver

5. Trade and Industrial Education Policy and Planning Committee Summary Report

6. Annual Report (1968), Journal of Industrial Teacher Education

7. Annual Membership and Circulation Report 1967 - 1968

8. A Preliminary Report on the Industrial Teacher Education Directory 1968 - 1969 - G. S. Wall

9. A Comparison of Selected Comtemporary Programs in Industrial Education, - Dr. Leslie H. Cochran

10. Effects of Field and Job-Oriented Technical Retraining on Manpower Utilization of the Unemployed - Dr. David Bjorkquist

MINUTES OF THE FIRST EXECUTIVE COMMITTEE MEETING

NATIONAL ASSOCIATION OF
INDUSTRIAL AND TECHNICAL TEACHER EDUCATORS

December 8, 1968 (2:00 - 4:00 p.m.)
Dallas, Texas

Members Present: Spence, Anderson, Lockette, Sams, Hanson, Williams, Miller, Yoho, Konecny. Guests: Calvin Cotrell, Roy Butler, S. R. Collins

1.0 Meeting called to order by President Spence.

1.1 Minutes of previous executive meeting approved as distributed.

2.0 Report of vice-president Hanson on plans for First General Session.

2.1 Vice-president Anderson distributed printed list of program participants for the Monday morning general session.

2.2 Vice-president Williams discussed the plans for the Tuesday breakfast session. It was suggested that a photograph be taken of all NAITTE officers.

2.3 Vice-president Lockette reported on final plans for the session devoted to research reporting.

3.0 President Spence appointed the following persons to the nominating committee: Denver Sams, Calvin Cotrell, Lewis Yoho, and Walter Brown.

4.0 The previous AVA requirement that members of affiliated organizations must be AVA members no longer applies; therefore, NAITTE will encourage AVA membership by its membership through notation on membership forms, but that no attempt will be made to assure AVA membership of NAITTE members.

5.0 The continuance of the annual NAITTE breakfast session was discussed. It was the consensus of the committee that the breakfast was a tradition that we did not want to interrupt. The possibilities of finding a sponsor for the breakfast were discussed. Several firms were suggested. but Philco-Ford will be contacted by Vice-President Hanson.

6.0 The need for a descriptive brochure for NAITTE was discussed. The committee concurred that a brochure was highly desirable. Vice-president Williams moved that Wayne Detwiler be asked to develop a brochure. Denver Sams seconded the motion, which was passed.

6.1 Vice-President Lockette moved that an editorial committee be appointed to review the work of Mr. Detwiler, and further that a $400.00 limit be placed upon the production of the brochure. Seconded by Hanson and passed.

7.0 The necessity of a membership list was discussed. The possibilities of the list being prepared by the mailing service which handles the JITE mailing was suggested. No recommendations were made.

8.0 A discussion of the honorary membership provisions of the constitution was held. Walter Brown moved to limit the total number of honorary memberships to be granted in any one year to one percent of the paid memberships from the preceeding year. Seconded by Sams and passed.

9.0 Denver Sams moved that a life membership category not be added to the constitution. Vice-President Anderson seconded the motion.

10.0 Secretary Miller reminded the four Vice-Presidents who served as program chairmen to see that reports and papers are made available to the secretary. Either 650 copies of the material to be distributed or the reproduction masters from which copies may be prepared by the secretary.

10.1 Vice-President Lockette moved that the new president of NAITTE contact the T & I Division Vice President, the IA Division Vice President and the appropriate officer for Technical Education to discuss the possibilities of a publication of the convention proceedings related to these three fields. Motion was seconded and passed.

11.0 Meeting declared adjourned by President Spence.

Respectfully Submitted,

W.R. Miller

Secretary-Treasurer

MINUTES OF THE FIRST GENERAL SESSION AND BUSINESS MEETING

NATIONAL ASSOCIATION OF
INDUSTRIAL AND TECHNICAL TEACHER EDUCATORS

Sunday, December 8, 1968 (8:00 - 10:00 p.m.)
Dallas, Texas

1.0 Meeting called to order by Vice-President Durwin Hanson. Convention program announcements were made.

2.0 Highlights of the year's activity were reviewed by NAITTE President Bill Spence.

3.0 The report of the Secretary was presented by W. R. Miller (a copy is enclosed).

3.1 The financial report was presented and reviewed by W. R. Miller, Jack Konecny, chairman of the Auditing Committee (composed of NAITTE trustees) moved the acceptance of the financial report. The motion was seconded and was passed (a copy is enclosed).

4.0 The NAITTE representative to the Industrial Arts Policy and Planning Committee, Lowell Carver, reported the activities of IAPPC during 1968 (a copy is enclosed).

5.0 The NAITTE representative to the Trade and Industrial Policy and Planning Committee, Gordon McMahon, reported the activities of the T & I Policy and Planning Committee during 1968. (a copy is enclosed)

6.0 The NAITTE representative to the Advisory Council for Vocational Industrial Clubs of America, Joe L. Reed, introduced VICA President Mr. Brock Grimes, who described the activities of VICA, and Miss Virginia Croft, who described the VICA publication headquartered at 105 Virginia Avenue in Falls Church, Virginia.

7.0 JITE Editor, Jerome Moss, reported on the activities and plans of the Journal staff and urged the submission of research related articles for publication consideration (a copy is enclosed).

8.0 A joint report of the Membership Chairman, Bill Mason, and the Circulation Manager, Howard McVicker, was reported by W. R. Miller in the absence of the authors (a copy is enclosed).

9.0 The chairman of the NAITTE Research Committee, Calvin Cotrell, reported on the activation of that committee after a lapse in reporting since 1965. Dr. Cotrell cited the committee's plans for cooperating with the Research Committee of AIAA, Dr. David Jelden, in an effort to acquire research reports and summaries for inclusion by ERIC-VT

in ARM. In addition, a bibliography 1966, 1967 and 1968 will be prepared for distribution to the membership. A plan is under way to prepare 100-word abstract for doctoral research completed in this field of industrial and technical education.

10.0 Dr. G. S. Wall, compiler of the Directory of Industrial Teacher Education summarized some of the gross data gathered in preparation of the Directory. It was indicated that it would be distributed early in 1969. (summary enclosed)

11.0 A report of the status of the Accident Prevention Manual for Shop Teachers was presented by Vice President William A. Williams. In addition, announcements of a safety course offered at Pennsylvania State University, as well as an American Safety Council publication for administrators of accident prevention programs was reported.

12.0 Meeting adjourned.

Respectfully Submitted,

W R Miller

W. R. Miller
Secretary-Treasurer

MINUTES OF THE SECOND GENERAL SESSION AND BUSINESS MEETING

NATIONAL ASSOCIATION OF
INDUSTRIAL AND TECHNI CAL TEACHER EDUCATORS

Tuesday, December 10, 1968 (7:00 - 8:30 a.m.)
Dallas, Texas

1.0 Vice-President Williams opened the session with an introduction of Dean Lewis Yoho of the School of Technology, Indiana State University, Terre Haute, Indiana, who described the National Seminar for College Deans held in June, 1969, at Lincoln, Nebraska.

1.1 Dean Yoho emphasized the need for direction in Vocational and Technical Teacher Education. The direction pointed to by the speakers at the Seminar was toward unified and coordinated Vocational-Technical Teacher Education programs in the colleges and universities of the United States.

2.0 Vice-President Williams introduced Dr. Harold Silvius who made the presentation of Honorary Membership certificates to the following individuals:

Lowell Carver	John Jarvis
Shriver Coover	Tom Olivo
Charles Cyrus	Kenneth Perry
C. Thomas Dean	Howard Reed
Chris Groneman	Wesley Stephens
Ivan Hostetler	Alvin I. Thomas

2.1 In addition to the recognition of these twelve honorary members, Mr. Floyd Mix, an honorary member inducted in 1967, who was not present at that time, was recognized by Vice-President Williams. The contribution of the Goodheart-Wilcox Company to the production of the Industrial Teacher Education Directory was acknowledged.

3.0 President Spence presented the past editor, Carl Schaefer, with a bound copy of the 1967-68 JITE.

4.0 Past President Denver Sams, chairman of the Nominating Committee, presented the following slate of prospective officers: Trustee, H. C. Kazanas; Vice-presidents (2), Joe L. Reed and Pat Atteberry; President, Carl Schaefer. Dr Lockette moved that nominations cease and that the secretary be instructed to cast a unamimous ballot for the nominees. The motion was duly seconded and passed.

4.1 Dr. Thomas Olivo, in a competent and professional manner, conducted the installation ceremony for new officers.

5.0 President Spence declared the meeting adjourned at 8:35 a.m.

Respectfully Submitted,

W R Miller

W. R. Miller
Secretary-Treasurer

SECOND EXECUTIVE COMMITTEE MEETING

NATIONAL ASSOCIATION OF
INDUSTRIAL AND TECHNICAL TEACHER EDUCATORS

Monday, December 9, 1968 (5:00 - 6:00 p.m.)
Dallas, Texas

Members Present: Spence, Williams, Yoho, Konecny, Hanson, Brown, Lockett, Sams.

1.0 Vice-President Williams requested that funds be made available for clerical work in conjunction with revisions preliminary to reprinting the Accident Prevention Manual. Jack Konecny moved that approximately $100.00 be authorized for expenditures in typing the changed manuscript for the Accident Prevention Manual. Seconded by Yoho and passed.

2.0 Considerable discussion was held with regard to the nature of the First General Session and Business Meeting. It was recommended that the program be composed of Presidential comments, Secretary-Treasurer's report, other business approved by the Executive Committee, and an appropriate guest speaker or other type of presentation.

3.0 After considerable discussion, it was recommended that the three-hour research session be organized into three distinct 50 minute periods.

4.0 The activities of the JITE board were discussed, and it was recommended that the JITE board meet at least one day prior to the third NAITTE Executive Committee at the annual convention.

5.0 A previous recommendation that a facilities planning guide be developed by NAITTE was brought before the committee for discussion. After considerable discussion it was moved by Lockette that a committee be appointed by President Spence with a charge to review the literature on facilities planning, develop a bibliography to be distributed at the 1969 convention, and recommend further appropriate action by NAITTE. Seconded by Brown and passed.

6.0 Adjourned 6:00 p.m.

Respectfully Submitted,

W. R. Miller

W. R. Miller
Secretary-Treasurer

MINUTES OF THE THIRD EXECUTIVE COMMITTEE MEETING

NATIONAL ASSOCIATION OF
INDUSTRIAL AND TECHNICAL TEACHER EDUCATORS

Tuesday, December 10, 1968 (4:00 - 5:00 p.m.)
Dallas, Texas

Members Present: Schaefer, Spence, McMahon, Brown, Atteberry, Yoho, Lockette, Kazanas, Moss, Miller, Hanson, Reed.

1.0 President Spence reviewed the 1969 Convention plan proposed by the AVA Board of Directors. It was agreed that we would schedule and plan the same type of program as in the past even though it may occur on different days.

1.1 Vice Presidential responsibilities for program planning and session chairmanships were assigned as follows:

Opening Session and Business Meeting - Pat Atteberry
General Session - Joe Reed
Research Session - Rutherford Lockette
Breakfast Session - Durwin Hanson

1.2 Vice-Presidents and committee chairmen will provide the secretary with 650 copies of presentations and reports for distribution by mail with no distribution at the convention.

2.0 Editor Moss reported on JITE board activities. The dedicatory statememts for honorary memberships which appear in the Journal will be increased from one to two in an effort to clear out the backlog of dedicatory statements. It was moved by Hanson and seconded by Reed that this recommendation be accepted. Harold Silvius, who prepares the statements was authorized to secure assistance in the preparation of the increased number of statements

2.1 Lockette moved that the JITE Board recommendation of Alan Suess and Joseph Impellitteri to serve as assistant editors to replace Larson and Littrell be approved. Brown seconded the motion and it passed.

2.2 It was the recommendation of the committee that the JITE board be authorized to contact department chairmen to secure names of last year's doctoral students and work with the chairman of the Research Committee to secure abstracts of doctoral studies for inclusion in the JITE if the JITE Board desires to continue this practice.

2.3 A change in the JITE cover design was recommended and Walter Brown moved that the recommended cover design be accepted. Lockette seconded and motion passed.

3.0 After considerable discussion of the problems associated with adequate funding for vocational teacher education at the state and federal level, it was recommended that a statement be prepared to express the needs for adequate funds to carry out vocational teacher education. This statement would be directed to the AVA Council on Teacher Education and other appropriate agencies. It was moved by McMahon and seconded by Reed that the recommendation be implemented by President Schaefer.

Respectfully Submitted,

INDUSTRIAL ARTS POLICY AND PLANNING COMMITTEE
SUMMARY REPORT
Mr. Lowell Carver
Made in Dallas, Texas; December 8, 1968

The following report is made to the National Association of Industrial Teacher Educators in order to highlight some of the activities that may be of interest and timely to N.A.I.T.T.E. This report will primarily cover the activities of the various committees that have functioned during the past year. My report is made from material submitted by committee chairman within the past four or six weeks.

A. Membership Committee

Dr. Will Miller, Chairman, this committee's activities for the year centered around the implementation of policies and procedures previously established.

1. The nation-wide network of industrial arts membership representatives came closer to reality as twenty (20) individuals were added. A total of forty-two (42) state and territorial representatives are now tied into the membership committee's promotional activities.

2. The committee continued to work with the AVA membership secretary in Washington Office, Mr. Robert Banks, to correct misclassification of industrial arts professionals.

3. The IA Division Membership brochure approved at the 1967 Convention was printed and distributed to the state representatives in time for fall, 1968, promotional activities.

4. As a member of the AVA Membership Committee, the chairman of the IA Division Membership Committee continued to press for alterations in the AVA policy regarding affiliated memberships for industrial arts personnel.

5. The IA Division continues to receive full support of both the AVA Membership Committee and the AVA Washington staff. Your divisional membership chairman has received immeasurable support from these groups in efforts to increase IA Division membership affiliation.

B. Publications Committee (Ernest L. Minelli, Chairman)

The purpose and function of the IA Publications Committee is to review what other special divisional committees are or will be doing, coordinating the publication efforts of the Division, and make recommendations to the IAPPC concerning our divisional publication needs.

1. A Guide to Improving Instruction in Industrial Arts

During August, the AVA published the long-awaited "A Guide to Instruction in Industrial Arts." The fourth edition of this important work. The booklet updates the unique goals, basic content and the philosophical approach of industrial arts, and is intended to be a guide for the field as the title implies.

This is a product of five years of study, research and evaluation by many individuals in the field, the volume turned its attention to the new but didn't discount completely the traditional which has served industrial arts so well in the past.

2. Innovative Programs in Industrial Arts (Available through AVA Office)

a. Recognizing change is the keynote of our times, with no segment of our society immuned to its effects, the Planning and Policy Committee of the Division authorized the Publications Committee, on its recommendation, to prepare a bulletin which would report innovative programs in industrial arts education. One purpose of the bulletin would be to highlight some of the innovative programs in industrial arts at all levels. These programs have special implications for all in making needed changes and to ease the transition from old to the new.

b. Chairmanship for this Committee was accepted by Dr. Walter C. Brown.

c. During the year reports were received on 118 programs and these reports are now being studied and categorized in preparation for their review by the committee members at this convention.

It is expected that the editing and finalizing of the study will be completed early in 1969 and that the materials can be forwarded to the publication committee for action.

3. Recommendations

a. That "Industrial Arts in Education" (1964) be revised.)

b. That a new publication The Teacher in Social and Educational Change be considered.

C. Awards Committee (Carl R. Wallis, Chairman)

The frame work within which the awards committee functions.

1. Certificate of appreciation -- Purpose is to recognize secondary school instructors participating in the programs of the national convention.

2. Leadership recognition

a. Professional Leadership

(1) Officers

It is the policy of the Industrial Arts Division to recognize its Vice-President, Chairman of IAPPC, and its Secretary-Treasurer at the time of the last National Convention at which they will preside.

(2) Non-Officers

It is the policy to recognize one or two leaders for outstanding contributions made as a non-officer or non-official capacity.

b. Service Award

(1) Emphasizing the term "Service", this award was approved in order to recognize "for the good of the cause" kind of activity.

(2) The framework approved was that the officers together with the cabinet members (total six members) of IAPPC select recipients through executive action. Selection has been completed and will be presented Thursday, December 12, 1968.

D. Recommended Practices Committee, Committee on Slow and Reluctant Learners--(Stig Emil Ralston, Chairman)

1. Purpose of the Committee

The primary function of the Committee on Slow and Reluctant Learners is to identify and describe those practices and/or programs in industrial arts that can or do contribute substantially to furthering the education of slow and reluctant learners.

2. Past Activities

In 1965-66, through the cooperative efforts of the Recommended Practices Committees on (1) Dropouts and Reluctant Learners, and (2) Slow Learners--together with selected personnel from the Research Council of the Great Cities Program for School Improvement--the plan of the committee was to determine those teaching practices that could change slow learners and reluctant learners into active learners.

A report of the final findings of this planned study will be presented at the Industrial Arts Division--"Teaching Practices that Can Prevent Dropouts" meeting that is scheduled for Wednesday, December 11, 1968, 2:00-4:30 p.m. Gold Room, Statler Hilton at the American Vocational Association's Convention in Dallas.

3. Future activities

Several issues were formulated at the Cleveland meeting for consideration by the Committee, and to be reported on in Dallas. We, no doubt, will be hearing much about the work of this committee at a later date.

E. Safety Education Committee (James O. Reynolds, Chairman)

Action #1: The committee approved a program on Safety Education to be presented to the Industrial Arts Division at the AVA Convention on Thursday, December 12, 1968, under the direction of the chairman.
2:00-3:30 p.m. "Safety: In School and on the Job"-- Harold Heldreth, National Safety Council, and James O. Reynolds, Dayton Public Schools, co-chairmen. Panel: Herb Siegel, Leonard C. Smith, Dan Irwin.

Action #2: A report of Dr. William A. Williams' success in having his Accident Prevention Program for School Shops and Laboratories published by the National Safety Council.

Action #3: The Chairman of the committee, who is also Chairman of the Joint AVA-NSC Committee, Denis Kigin and William A. Williams, who are members of the National Safety Council Committee, attended the National Safety Congress in Chicago, October 27-30, 1968. The Chairman of the Industrial Arts Division Safety Committee will serve as Chairman of the General Departmental meeting of Secondary Education on Wednesday, December 11, 1968, at the American Vocational Association in Dallas on "Safety and Work Hazard Implications" 9-11:30 a.m. This involves new legislative implication.

F. Editorial Committee (Robert Rudiger, Chairman)

1. The major work of this committee centers around the planning, make-up, and distribution of the A-V Journal as it relates to industrial arts. In order to do this a joint meeting of all division editors is held in Washington, D. C. each spring. At this meeting a review is made of the past year's efforts and plans are formulated for the next year.

2. Many problems are brought to the attention of the committee for consideration; such as deadlines, quality of articles submitted, space to publish all the articles submitted, securing good authors, nature of articles, publishing articles of non-members, and public service advertising.

   Our representative has a very responsible task as you can see. I am sure we can be assured that Dr. Rudiger will look out for our interests.

G. Legislative Committee (Walter Brown, Chairman)

A resolution in support of federal legislation for state supervision of industrial arts was discussed and agreed upon by the Legislative Committee at its meeting in Cleveland, Ohio, last year. The resolution was further refined and presented to the IA cabinet at its 1968 summer meeting.

The Legislative Committee will again meet on the subject of legislative support for state supervision with the hope that the American Vocational Association will adopt a resolution and include the subject in their program of legislative work.

H. Evaluative Committee (Dr. Walter Robinson, Chairman)

The Committee on Revision of Evaluative Criteria is considering criteria for instruction, physical plant and facilities, and objectives. Prepared material has been prepared and circulated to all members of the committee as a whole for suggestions and criticism. A revised draft will be considered at the Dallas meeting. Following the Dallas meeting copies will be circulated strategically for teacher reaction.

I. Research Committee -- Sub-Committee on Research Awards (Ralph O. Gallington, Chairman)

This committee has collected, examined and discussed reports which have been submitted for examination and have made recommendations for the awards. Final action will be taken at this convention and publicity given at a later date.

SUMMARY REPORT
TRADE AND INDUSTRIAL EDUCATION
POLICY AND PLANNING COMMITTEE
PRESENTED AT
NAITTE BUSINESS MEETING
AVA, DALLAS, TEXAS
DECEMBER 8, 1968

The T & I Policy and Planning Committee held three meetings in Cleveland, Ohio on December 2, 4, and 7, 1967. Three additional meetings were held in Washington, D. C., February 29, March 1 and 2, 1968.

The following reports were presented during the meeting in Cleveland:

Report of AVA Journal -- Dr. Melvin Barlow

Report of Advisory Council Report -- Dr. Melvin Barlow

Vocational Education, The Bridge Between Man and His Work -- Dr. Melvin Barlow

Report of the Vice President -- Dr. Lee Ralston

AVA Developments and Plans

Trade and Industrial Education Yearbook

New Designs for the Challenge of the 1970's

Financial and Budget Report

T & I Committee Replacements

T & I Committee Reports

AVA Committees

AVA-BAT Committee

National Advisory Council

Mid-year Meeting -- All P & P Committees

AVA General Report -- Dr. Lowell Burkett

VICA Report -- Mr. Larry Johnson

T & I Research Committee Report -- Dr. Carl Schaefer

U. S. Office of Education Report -- Dr. Merle Strong

Program Services -- Dr. Merle Strong

Program Planning & Development -- Dr. Sherrill McMillen

T & I Education Program -- Dr. Ernest Studebaker

AVA, T & I Membership -- Dr. Robert Reese

Report of Publications -- Dr. Von H. Robertson

AVA Publications

T & I Publications -- T & I Yearbook on sale through American Technical Society. Need expressed to continue the T & I Yearbook. Information was given that the AVA publications committee was interested in national guide for developing evaluative criteria as stated in the VEA of 1963.

Dr. Robert Reese moved that a statement be prepared by the Policy and Planning Committee regarding the functions and activities of the USOE as it currently relates to the operation of vocational-technical programs in the United States and to be presented to the proper person in the U. S. Office of Education. Dick Nelson seconded the motion; the motion passed.

Chairman Robertson appointed a committee to prepare this report. The committee is to be composed of Bob Reese, Chairman; Harry Lewis and Dick Nelson as members.

This report as prepared and accepted by the Policy and Planning Committee is as follows:

"The Policy and Planning Committee of the Trade and Industrial Education Division of the American Vocational Association has made a careful review of the function and activities of the U.S.O.E. as it is currently relating to operations of vocational-technical programs in the United States.

The increasing role of vocational education in the expanding technology of the American economy and manpower development would suggest that provisions should be made for the strongest possible leadership and that this leadership must, of practical necessity, be provided by persons who have engaged in and experienced vocational activities which enable them to become fully knowledgeable in the field of vocational education.

The recognition of the need for and the status of vocational education is evidenced by the continuing action of the Congress in providing funds for expanding and developing programs.

The Policy and Planning Committee notes with dismay that the current organization of the U.S.O.E. does not provide for the utilization of vocational education leadership at the policymaking level. Thus, policy decisions are being made by persons without appropriate knowledge or experience on which to base decisions.

This condition is amplified by the fact that although the Congress has identified certain needs in vocational education in passing important legislation, the U.S.O.E. proceeds to implement this new legislation without consideration to the expressed wishes of the Congress.

For example, in passing the Professions Development Act, the House Education and Labor Committee made specific mention of the need for preparing leadership personnel for vocational-technical education. The act calls for an advisory committee to advise the U. S. Commissioner of Education as to needs in the profession and administrative guidelines for the Act. Nevertheless, when the committee was appointed, not one single person knowledgeable in vocational education was named to this committee.

The Policy and Planning Committee is further concerned over the low administrative level of vocational education personnel within the present structure which greatly reduces their effectiveness in joint decision-making with other governmental agencies on vocational education and manpower development problems.

The Secretary of HEW is on record as recommending that certain manpower training functions in recent social security legislation be assigned to the Department of Labor even though, in most states, public vocational programs would be called on to provide the instruction.

The AVA Policy and Planning Committee for Trade and Industrial Education is vitally interested in the evident policy of the Secretary of HEW that educational programs should be assigned to non-educational agencies.

Further concern involves the elimination of the regional conference concept which for many years provided among other things a continuity of purpose, a problem-solving forum and an opportunity to become identified with a program of manpower development of national economic and social purpose. This spirit is no longer being passed on to new vocational educators."

Fred Gordon reported that the National Association of State Supervisors of Trade and Industrial Education in annual session at this Convention passed the following resolution unanimously: "NASSTIE approved the proposed establishment of a National Leadership Center for VICA youth, recommending:

(1) That the Administrative Board of VICA have educational specifications prepared and solicit external support and resources which will lead to the establishment, operation, and maintenance of the Center, and

(2) That NASSTIE advise the Executive Board of AVA (through the Vice-President for Trade and Industrial Education) of its action and solicit their endorsement of the project so essential for the maximum development of youth in trade, industrial-technical education."

Von Robertson moved acceptance of the report and that the Policy and Planning Committee go on record as approving the concept of a youth development center for VICA. Harry Lewis seconded the motion; motion passed.

Dick Nelson moved that the Policy and Planning Committee be adjourned to meet next on February 29, 1968 in Washington, D. C. Charles Bates seconded the motion; motion passed.

The Policy and Planning Committees of the various divisions of the American Vocational Association met in general session in the Statler Hilton Hotel in Washington, D. C., on Thursday evening, February 29, 1968, to hear AVA staff reports. This meeting was in session from 7:30 p.m. to 9:30 p.m. Mr. Lowell Burkett presided for this session.

The Policy and Planning Committee of the Trade and Industrial Education Division of the American Vocational Association convened in the Ohio Room of the Statler Hilton Hotel, Washington, D. C., Friday, March 1, 1968, 9:00 a.m. with Chairman Von H. Robertson presiding. All of the members of the committee were present except Howard F. Nelson.

Chairman Robertson welcomed the group to the committee meeting including Tom Olivo, Vice-President Elect, and Robert McAbee, Trade and Industrial Education Program Chairman for the 1968 convention in Dallas. It was stated that Howard Nelson was out of the country on an assignment and would not be present for this meeting.

The T & I Policy and Planning Committee meeting held in Washington included the following items:

The Chairman had Vice-President Ralston appoint representatives to the scheduled meeting of the AVA Departments. The Departmental meetings to begin at 1:30 p.m. and last until 5:00 p.m. on this date.

The Departments listed below will be represented by the individuals listed beside each Department:

. Adult - Herbert Donaghay

. Secondary - Rosalie Risinger
Charles D. Bates

. Post-Secondary - Walter Bialobrzeski
Fred Gordon

. Supervision and Administration - Dick Nelson
Lee Ralston

. Research and Evaluation - Durwin Hanson

. Teacher Education - Von Robertson

. Related and Special Programs - Catherine Grant

Plans for the 1968 Convention to be held in Dallas were outlined by Robert McAbee.

Fred Gordon discussed the "Program on Disadvantaged" held in Minnesota.

Concern was indicated for the AVA Convention to present programs for vocational teachers.

Officers of the T & I Planning Committee for 1968 were elected:

Chairman - Walter Bialobrzeski

Vice Chairman - Charles D. Bates

Secretary - Rosalie C. Resinger

Mr. Larry Johnson reported on VICA activities which included:

1968 VICA Week - March 10 - 16, 1968

1968 VICA Convention, June 23-26, 1968, Oklahoma City, Oklahoma

Promotional materials for VICA

Progress on VICA Youth Development Center

Dick Nelson presented promotional materials, including a proclamation from the Governor of California designating a week for Industrial Education.

Meeting adjourned at 3:00 p.m., March 2, 1968.

NAITTE

JOURNAL OF INDUSTRIAL TEACHER EDUCATION

December 8, 1968

TO: NAITTE Membership

FROM: Jerry Moss, Editor

SUBJECT: Annual Report (1968), Journal of Industrial Teacher Education

The editorial staff is happy to announce that the American Technical Society has agreed to continue supporting our Journal for another year. We know that the entire membership joins us in thanking the Society for its generous assistance. (That cloud-like ring hovering near Mr. Paul's head is not smoke rising from his cigar!)

I am sure that you are all proud of the fact that the Journal is gaining scholarly recognition in the field. Articles from it are being cited increasingly in reviews of research and in research reports dealing with occupational education. Lest we become too satisfied, however, it is well to remember that ours is the only publication in the whole field of occupational education which purports to report scholarly papers, and that your editorial staff is becoming very concerned over the lack of manuscripts which we have been receiving. Since becoming Editor in June, I have received a total of only twenty-three unsolicited manuscripts for publication in the Journal. After review by three editors, about 52% were accepted as submitted, 17% were accepted after major revisions had been completed by the authors, 22% are still in the hands of the authors after being returned for major revisions, and 10% were rejected outright. And, of the twenty-three manuscripts received, almost 40% emanated from just three institutions.

The present rate of submission is inadequate to maintain a high-quality publication. In order to help alleviate our problem, the staff has decided to act in three ways. First, we are publishing two special issues of the Journal this year and are soliciting articles from specific people for them. The Fall issue is devoted to "research policy" and the Spring or Summer issue will focus upon "program evaluation". Without these two special issues we would probably not have enough manuscripts for four issues this year -- certainly not four good ones.

Second, I am taking this opportunity to request your help. The largest untaped publication resource is degree research, especially doctoral studies. In the interest of gaining proper recognition for the efforts of your students, your departments, and the advancement of the profession, I urge you to have each of your candidates submit an article to us based upon his dissertation. The Dissertation Abstracts does not provide enough information about each study to be very useful, and ERIC's Research in Education will make available, at most, a two hundred word abstract. The only worthwhile, reasonably available outlet is the Journal. You should therefore attempt to make the preparation of a five to fifteen page

manuscript standard practice for your candidates. All of us will benefit. Directly related to this idea, the Editorial Staff agreed last year that doctoral students in residence should receive the Journal free of charge. Milton Larson has been conducting a survey of department chairmen to uncover the names of eligible doctoral students, if you haven't received or returned this survey form please contact Dr. Larson.

As a third means to improve the quality of the Journal, the editorial staff is beginning to explore the implications of increasing the scope of its editorial concerns and its constituency. For example, we are starting to investigate the possibility of becoming the outlet for scholarly works in the broad field of vocational, technical, and practical arts education.

Finally, I should report that we are utilizing the name change of our organization as an opportunity to redesign the Journal cover. One of the forthcoming issues, in the not-to-distant future, should reveal a face-lifting.

The entire staff is anxious to continue the good works of its predecessors. You can help greatly by using the Journal as an outlet for your scholarly writings, and by giving us the benefit of your counsel; we need and welcome your suggestions and criticisms on any relevant matters.

Annual Report
Membership and Circulation Report
1967-68

On November 15, 1968, the terminal date for the past year's efforts, the NAITTE paid membership was 610 compared to 569 a year ago at the same time, an increase of about 7% for the year. This increase can probably be attributed to many reasons or causes, but it is felt that getting out the two-way envelope reminders earlier than in past years has contributed greatly. The renewal rate is up considerably.

The mailing picture is as follows:

610 paid memberships
34 honoraries
164 paid subscriptions (libraries, etc.)
808 total mailing

We also have several persons who were members prior to 1967-68 but did not join this past year. Efforts are being made to bring them back into the fold. A reminder is going out to arrears members advising them that the NAITTE Journal <u>will</u> <u>not</u> be forthcoming unless they pay dues.

Currently we are receiving very few complaints concerning problems of circulation as compared to the quantity received prior to our present system of records and communications with the treasurer. Apparently our card system is proving successful.

We do have some difficulty with people who change addresses without notification and then complain that the Journal is not being received at their new address. This is not widespread but is disturbing when a complaint arrives and we have no evidence that the individual had moved - as a result the Journals have been sent to an old address.

At the present time NAITTE does not have any appropriate promotional literature. If we are to continue to attract new members, we must develop some promotional material that can be distributed to potential members. Without this material recruitment of new membership is under a severe handicap. It is therefore suggested that the president appoint a committee to study this problem and to develop a brochure, folder, and/or other material to stimulate interest and promote membership in our organization.

We plan to send letters to department heads at all colleges and universities that offer degrees in industrial education requesting their assistance in promoting NAITTE membership. A sample Journal and several membership forms will be sent to each institution for promotional purposes.

Carl Schaefer on his agenda for the December 10 meeting indicated "special distribution to doctoral students," as a topic I (McVicker) should report on. Very specific guidelines for distribution to doctoral students should be developed. Non-college or university staff, full-time students, only those in last year of work , or all doctoral candidates are categories for consideration when developing distribution guidelines. We would like to suggest a possible solution: provide the Journal to graduate (doctoral) students who are not regular employees of a college or university at a reduced cost of $1.00 per person yearly. Have all issues to any one institution bulk mailed (the $1.00 fee would about cover mailing). Each institution would be responsible for providing the necessary information (name and status) concerning each doctoral candidate and as issues (Journal) become available the proper quantity will be sent to the department for distribution.

We feel we have made progress in systematizing the membership and circulation procedures which has resulted in increased efficiency in maintaining each member's status and getting correspondence to him. We would like to suggest numbering the membership cards. By chronological numbering an accurate count can be arrived at without time consuming effort.

We wish to thank Dr. Wilbur Miller for his patience and cooperation during the past year.

Respectfully submitted,

William H. Mason

A Preliminary Report on the

Industrial Teacher Education Directory - 1968-69

by G. S. Wall

NAITTE
Dallas--1968

It is necessary for me to limit my report to some of the general aspects as the Directory is still in the process of being produced. It is hoped that it will reach you during the first week in January.

The format remains the same. Excluded this year are those institutions which do not grant at least a bachelor's degree with a major in industrial arts education. Institutions offering only vocational industrial certification work are still included. (I think there is only one)

The 53 state departments (including the District of Columbia, Puerto Rico and the Virgin Islands) are included. Of these, five do not have any institutions providing industrial teacher education. These are Alaska, Delaware, the District of Columbia, Vermont and the Virgin Islands, The other 48 states have a total of 221 institutions--231 departments, as 10 have separate industrial arts and vocational teacher education. Unhappily, 4 institutions and 11 state departments failed to send data, so their 1967-68 data is reported.

Nine states have only 1 institution. About one-fourth (53) of the institutions listed are found in five states--the largest number of institutions in one state is 14, this being Texas; California has 11 included; Ohio--10; and Michigan and Oklahoma each have 9.

The 1967-68 Directory listed 225 institutions or 4 more than this year--seven institutions having been dropped because of the new policy and only 3 additions were made. These institutions, however, have more teacher educators employed.

Of the 2,747 personnel listed (this is a preliminary count), only 126 are state department personnel, the remaining 2,621 being persons on a college staff. This is a gain in total of about 230 over the 1967-68 number of 2,517. Interestingly, in preparing the index it was necessary to list about 570 names which did not appear in the 1967-68 index. It was also necessary to strike out over 335 names that were in the 1967-68 edition but were not listed currently.

It appears that industrial teacher education continues to expand--the departments are larger in that the average department in 1968-69 has almost 12 members on its staff, which is 2 more than the almost 10 average found in 1967-68. There is only one institution listed in 1968-69 as having only one person as an industrial teacher educator. At the other extreme, one institution has 88; the next largest having 71.

Again, it is regretted that the schedule of publication of the Directory and the holding of this meeting precludes extracting more detailed information for presentation. It is hoped that the Directory will serve you well in the year to come.

A COMPARISON OF SELECTED CONTEMPORARY PROGRAMS IN INDUSTRIAL EDUCATION

A Review of a Doctoral Dissertation

Completed at

Wayne State University

Presented by:

Leslie H. Cochran

Wayne State University

NAITTE Research Session
AVA Convention

December 9, 1968
Dallas, Texas

A COMPARISON OF SELECTED CONTEMPORARY PROGRAMS IN INDUSTRIAL EDUCATION

An Abstract by:

Leslie H. Cochran
Department of Industrial Education
Wayne State University

One of the problems that has long plagued industrial educators is their lack of common understanding of what is being promoted in the field. As a result, many plans have been developed with little concern for preceding or existing attempts in curriculum development. Those studies that have focused on the problem have been primarily evaluative in character, and provide only a limited basis for comparison.

And yet, each time an innovative plan or new program is introduced several common questions come to the forefront. For example, how does the plan fit into the total educational program? Is it really new or is it only a new title to disguise old practices? How is it different from the old practices? Or, what implications will it have for students and staff? These and other questions cannot be answered by evaluating a particular plan, but need to be considered by comparing various programs on a uniform framework.

Statement of the Problem

In this respect, it was the purpose of this study to compare and analyze selected contemporary programs in industrial education in an attempt to determine the common elements, basic directions, and their significance to the field. More specifically, the study focused upon three major objectives: (1) To review historically industrial education programs on the secondary level to illustrate the position and character of current plans; (2) to develop a conceptual framework for industrial education that could be used to analyze any of the contemporary programs in the field; and (3) to apply the framework to the selected programs that meet the pre-established criteria for an analysis of each.

Methodology for the Study

To attain the stated objectives it was necessary to develop a systematic operational plan. This called for a historical review, an identification and selection of programs to be studied, the development of an instrument to compare the selected programs, and methods for collecting, analyzing, and interpreting the data.

Historical Review

A review was made of library bulletins, periodicals, and references to historically trace the development of industrial education programs at the secondary school level. This overview focused primarily on approaches, movements, and programs prior to 1960 in an attempt to provide a historical perspective for the study and to suggest basic relationships between current curriculum plans.

Identification and Selection of Programs

Two major sources were utilized to identify the secondary school programs to be studied. This involved, first of all, a continuation of the review of literature. Secondly, a paper by Marcus V. McWaters titled a "Survey and Brief Descriptive Analysis of Curricular Innovations for Secondary School" that was presented at the Fifty-Fourth Mississippi Valley Industrial Arts Conference, November 9, 1967 was reviewed.

Thirty-five programs were identified. Following a request for further descriptive materials, the programs were compared with the pre-established selection criteria which included five factors:

(1) That the program had been developed and implemented since 1960.

(2) That the home base (sponsoring university or public school system) was located within Region V, U. S. Office of Education (which includes Indiana, Illinois, Michigan, Ohio, and Wisconsin).

(3) That the program was under study and evaluation in an industrial teacher education program.

(4) That the program was at the experimentation and testing stage in the secondary schools.

(5) That the descriptive material concerning the program was available either in the form of articles or official releases.

The programs selected included the American Industry Project, Functions of Industry, Galaxy Plan, Industrial Arts Curriculum Project, Industriology Project, Orchestrated Systems Approach, and the Partnership Vocational Education Project.

Development of the Instrument

Prior to the formal construction of an instrument to compare the selected programs, an extensive review was made of related research, textbooks, and articles in the fields of curriculum and industrial education. The data collected in this review provided a basis for this research, and suggested the rationale for a systematic study of the programs in industrial education.

Based on the findings of this review, a 119-item check-list was developed. This tentative instrument was presented to members of the doctoral committee and a committee of judges. Through a series of individual conferences with the judges and doctoral committee members, these items were reduced to fifty. In structuring this sample every effort was made to maintain the representativeness of the original items. Attention was focused on the elimination of duplication, improved clarity, and concisement. A certain amount of homogeneity in the sample was stressed so that no item could be picked out because of extraneous or incidental grounds. As the appraisal and refinement continued, concern was expressed by the judges over the lack of specificity in the instrument.

Based upon the suggestion to make the instrument more specific, consideration was given to the Q-technique. The Q-Sort method was adapted to provide a forced-choice procedure for the study. In this way each participant could use his own frame of reference to characterize a particular situation by arranging the predetermined statements in their order of importance.

As a result, the fifty statements were place on individual cards, refined again by the judges, and sent out on a pilot basis to three programs that had not met all of the selection criteria. Based upon the responses of the participants to the pilot instrument, minor revisions and improvements were made.

Data Collection and Interpretation

Three basic procedures were utilized to obtain descriptive material to compare to seven selected programs. (1) An initial request was sent to each of the leaders associated with the programs to secure articles, and other materials describing their program. (2) The fifty statements, in Q-Sort form, were sent to each of the participants. (3) Upon the return of each of the initial instruments, a follow-up interview was scheduled with each of the leaders.

The data collected and reported were interpreted in two distinct forms. This involved a brief overview of each of the programs on the basis of the interview and other descriptive materials. Secondly, the cards received from each of the selected programs were sorted according to the prearranged frequency distribution.

Selected Findings

The findings in this study can be grouped under three major sections: (1) historical, (2) program descriptions, and (3) program comparisons. The first two of these headings provided rationale for, and a description of many of the programs reviewed in the study. For the purposes of this report, however, focus was directed on the specific comparison made between the seven selected programs. The data summarized in Tables 1, 2, and 3 project the positions taken by the representative of each program in respect to the fifty statements. In this respect, a statement ranked in column A would represent the highest degree of support, while those dispersed in columns B through G would represent descending degrees of support.

TABLE 1

RANKING OF STATEMENTS PERTAINING TO OBJECTIVES ACCORDING TO PROGRAM CODINGS[a]

Statements	Rating Cards						
	A	B	C	D	E	F	G
5) The program is based on selected experiences that provide for an understanding and appreciation of industry and its workers.		1,2 & 5	3 & 7	6	4		
8) The program is directed toward the development of specific salable technical and manipulative skills designed to aid the student in entering employment at the completion of the program.			3	4	6	1,5 & 7	2
11) The students develop ability to select, purchase, and use wisely the products of industry.			1 & 3	4,6 & 7	2 & 5		
15) The program provides for both male and female students.		1,3 & 5		2,4 6 & 7			
20) Activities in the courses are directed toward outcomes for avocational interests and hobbies in the crafts.					4 & 7	3 & 5	1,2 & 6
25) The program studies life needs as created by or related to industry.	4	5	1 & 6	3 & 7	2		
28) The program promotes occupational guidance by helping the student assess his occupational potential, interests, and capabilities.	2	1,3 &4	6	5	7		

TABLE 1--(Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
37) A student is allowed to choose an area of concentration according to his interests and abilities.	3		2 & 6	1,4 & 7	5		
40) Consideration is focused on the development of an appreciation for good design and craftmanship.				1,3 4,5 6 & 7	2		
46) The program is directed toward providing exploratory experiences in selected industrial type activities.	2	4	1,5 6 & 7	3			
47) The development of desirable work and safe habits are integrated into the courses of study.		3	1,4 & 6	2 & 7	5		
49) The program is designed to provide the student with basic technical skills and occupational guidance information on a pre-vocational basis.		2		3,4 5 & 6	1 & 7		

[a]The rating of each of the programs is reported according to the following code: 1--American Industry Project, 2--Functions of Industry, 3--Galaxy Plan, 4--Industrial Arts Curriculum Project, 5--Industriology Project, 6--Orchestrated Systems Approach, and 7--Partnership Vocational Education Project.

TABLE 2

RANKING OF STATEMENTS PERTAINING TO CONTENT ACCORDING TO PROGRAM CODINGS[b]

Statements	Rating Cards						
	A	B	C	D	E	F	G
1) Content is organized so that the major emphasis is placed on manipulative type activities (operational rather than informational).				4,5 & 6	3	7	1 & 2
2) The content in industrial education courses is closely correlated with subject matter taught in other departments in the areas of science, mathematics, and English.	7			1	2,5 & 6	3 & 4	
3) The program provides for experiences in research and development as they are utilized in the manufacturing industries.		2 & 6	1 & 7	3,4 & 5			
4) The program provides occupational information about job requirements, working conditions, salaries, and how to get a job.		4	2,3 & 5		1 & 6	7	
6) The content is predetermined by the teacher alone with problems selected that relate to the needs of students and the community.				1,2 & 4	7	3,5 & 6	
10) The program provides for practical applications of scientific principles.		7	1,3 4 & 6	2 & 5			

TABLE 2--(Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
17) The program provides for instruction in the use of common hand and machine tools used in industry.			3 & 4	1,2 & 6	5 & 7		
21) Curriculum content is derived through an analysis of job positions in an occupational cluster as identified by the Dictionary of Occupational Titles.			2		3 & 4	1,5 6 & 7	
22) Content is primarily concerned with informational topics (technical, guidance, and general) rather than manipulative type activities.				4 & 7		1,2 3,5 & 6	
26) The content is determined through a team approach involving the teacher and an advisory committee representing management and labor.		3		1,2 & 4	6 & 7		5
29) The program focuses on a study and the use of industrial materials and processes.			5	3,4 6 & 7	1	2	
30) Industry is studied by concentrating on the production of goods and the servicing of products.	2 & 6	7	5	3	1 & 4		
31) The program considers industry in its totality, including labor, capital, and distribution.	1 & 5	2,4 & 7		3 & 6			

TABLE 2 -- (Continued)

	A	B	C	D	E	F	G
32) The program is based on a wide variety of selected experiences that sample several industries.	5	6	2 & 7	1,3 & 4			
39) The program provides experiences with selected basic manufacturing processes.		2	5	1,3 6 & 7	4		
41) Content is identified through an instructional analysis of major industrial activities or trades such as welding (trade) or activities in industrial arts (plastics).	3		5		2 & 6	1	4 & 7
42) The dominant technologies such as mechanical, chemical, and electrical are the basic source for content.				3,5 & 7	2 & 6	1 & 4	
44) Content is classified under such instructional areas as woodworking, metalworking, and drafting.					3 & 5	2 & 7	1,4 & 6
45) A study of industry is made by concentrating on the construction and manufacturing industries.	4			6 & 7	1,2 3 & 5		
48) Industry is studied through an in-depth concentration on one industry.				2 & 5	1,6 & 7	3 & 4	
50) Content is identified from an analysis of selected industrial payroll jobs.			2	3	5	1 & 6	4 & 7

[b]The rating of each of the programs is reported according to the following code: 1--American Industry Project, 2--Functions of Industry, 3--Galaxy Plan, 4--Industrial Arts Curriculum Project, 5--Industriology Project, 6--Orchestrated Systems Approach, and 7--Partnership Vocational Education Project.

TABLE 3

RANKING OF STATEMENTS PERTAINING TO TEACHING METHODS ACCORDING TO PROGRAM CODINGS[c]

Statements	Rating Cards						
	A	B	C	D	E	F	G
7) Application of the content is made in two or more laboratories within the department. For example, drawings needed for the development of a product are completed in a drafting room prior to construction in another laboratory.		5	7	1 & 2	4 & 6		3
9) Students make use of research principles and techniques as they undertake projects, experiments, or reports.		1 & 7	2,4 5 & 6			3	
12) Students are grouped for class activities according to standardized test scores, including intelligence quotient, and verbal and quantitative scores.			4		1	2,3 & 7	5 & 6
13) Multiple "tracks" are built-in to the program to accommodate individual differences in ability and interest.		3	4 & 6	2,5 & 7	1		
14) Focus is placed on individualized instruction through programed instruction or individual progression at a work station.			7	1 & 6	3 & 4	2 & 5	
16) The class organization and major activities are managed and directed by students with the teacher remaining in the background.		6	3	1,2 5 & 7		4	

TABLE 3 -- (Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
18) Students develop desired outcomes through experimentation with, and testing of, industrial materials.		7	1 & 3	2,5 & 6	4		
19) Instruction is oriented around problem solving experiences.		1,4 6 & 7		3 & 5	2		
23) A team of science and industrial education teachers is used to correlate content taught in the two fields.	7				1,2 3 & 6	4	5
24) Activities included in the courses are jointly planned by the student and teacher.			5 & 6	1,2 & 7	3	4	
27) Provision for individual ability differences is made through a multi-activity organization.		5 & 6	1,2 3,4 & 7				
33) The program encourages students to work and plan together as a team.	6	3	1,4 5 & 7	2			
34) Emphasis is placed in the various units on the use of instructional sheets (assignment, operation, and information).				1 & 5	3,4 & 7	2 & 6	
35) Role playing is advocated as a method to more accurately interpret industry.		1,2 & 6	4		3,5 & 7		

TABLE 3 —(Continued)

Statements	Rating Cards						
	A	B	C	D	E	F	G
36) Instruction is focused largely on units to be studied by the entire class at one time.			2	1,4 & 5		3 & 6	7
38) Instruction is focused on basic generalizations (concepts) covering an understanding of industry.	1,4 & 7	5		2,3 & 6			
43) The student progresses from a general understanding of industry (or a system) to specific units (or components).	1,3 5 & 6	4	2 & 7				

[c]The rating of each of the programs is reported according to the following code: 1--American Industry Project, 2--Functions of Industry, 3--Galaxy Plan, 4--Industrial Arts Curriculum Project, 5--Industriology Project, 6--Orchestrated Systems Approach, and 7--Partnership Vocational Education Project.

Interpretation of the Findings

Based on the historical review of early industrial education programs, the descriptive overview of on-going programs, and the systematic comparison of selected programs found in this study, numerous conclusions could be made. It is not the purpose of this research, however, to make a prolific listing of these. Instead, four major conclusions have been identified which warrant the attention of the profession.

Conclusions

(1) The field of industrial education has been in a constant state of flux and reorientation since its early inception in the secondary schools. In the period since 1960, however, more modifications with wider implications have been produced than in any of the preceding decades during the twentieth century.

(2) There are identifiable curriculum elements in the field of industrial education that can be incorporated into a conceptual framework to systematically compare contemporary industrial education programs.

(3) There is general agreement between individual leaders associated with the selected programs under study on at least fifty percent of the items in the conceptual framework. Although this agreement is evident, it must be remembered, however, that the structure of these programs may vary greatly since different positions may be taken on key issues.

(4) There is general agreement among all of the selected programs, as demonstrated by the identified leaders, on specified items in the conceptual framework. In general these similarities may be stated as follows:

> (a) A lesser degree of emphasis is placed on manipulative type activities, while the emphasis on the application of scientific principles through experiences in research and development has been increased.
>
> (b) Provision for individual differences is made through multi-activity organization so the student can progress from a general understanding of industry to more specific tasks.
>
> (c) The classification of instructional content under such areas as "woodworking" and "metalworking," and the focus on activities directed toward avocational interests and the crafts are de-emphasized.

(d) A "middle-of-the-road" position is evidenced in regards to the emphasis placed on good design and craftsmanship, the use of common hand and machine tools, and consumer knowledges as related to the selection, purchasing, and wise use of industrial products.

Observations

In conducting this research several observations were made in regard to this study. Although these are not directly or conclusively supported by the findings, there was sufficient support to warrant their inclusion.

(1) The selected programs under study revealed an increased amount of emphasis on the interpretation of industry as one of the dominant objectives for industrial education. The basis for this shift was because of the increased complexity of the technological society, and the need for greater occupational information to properly understand and interpret the role of industry.

(2) In general, the selected programs represent a reaction to the conventional industrial education programs of preceding decades. This general trend, represented by the programs under study, is illustrated by the standard terms, such as "metal-working," "instructional sheets," and even "industrial arts" which are in various degrees of disrepute. Concern is also evidenced in respect to basic experiences and craft-oriented activities included in conventional programs.

(3) Each of the programs present a structure that reveals particular strengths, but none of the programs is ready for final evaluation since they are in the development and implementation stages.

(4) The similarities and differences between the programs suggest the need for further attempts in curriculum development. Each of these illustrate the need for continual development and refinement to project future industrial education programs.

(5) The thirty-five identified programs concerned with innovative approaches reviewed in this study suggest the dissatisfaction of the profession with on-going industrial education programs in secondary schools. There is a genuine searching for the direction and role of industrial education in the total educational program.

Effects of Field and Job-Oriented Technical Retraining on Manpower Utilization of the Unemployed

N.A.I.T.T.E.
Monday, December 9, 1968
2:00 - 5:00 p.m.

Associate Professor of
Industrial Education
University of Missouri
Columbia, Missouri 65201

Two years ago at the American Vocational Association Convention in Denver, we presented an interim report on the research project entitled, "Effects of Field and Job-Oriented Technical Retraining on Manpower Utilization of the Unemployed." That report focused on the selection of students, the training programs and initial placement of graduates. The purpose of this presentation is to present data gathered through interviews during the first two years following training. After briefly relating the characteristics of the training programs and the students, and the initial placement of graduates, I will describe the variables used in evaluations, our findings, and the conclusions which we have drawn.

The purpose of this study was to compare a specific job-oriented program with a broad field-oriented program for the preparation of technicians in the field of mechanical technology. Both programs were operated under the Manpower Development and Training Act and were approximately 50 weeks long.

The Training Programs

The job-oriented program was intended to prepare tool designers and was operated by the School District of the City of Allentown, Pennsylvania. Through the use of an industrial advisory committee, subject matter was selected which was considered to be essential for the preparation of a tool designer. Much of the effort of the program administrators was spent in the integration of this subject matter to develop meaningful total.

The field-oriented program was in machine and tool design technology, and was developed to prepare individuals for a variety of positions in the field of mechanical technology. This program was planned and operated by the Department of Continuing Education in Engineering of The Pennsylvania State University. Courses were included in the curriculum which would develop a broad basic knowledge of mechanical technology. This program was taught on a two-year campus of the University where students shared facilities with approximately 800 full-time students in baccalaureate and associate degree programs.

About one-half of each of the programs of instruction was devoted to drawing and design. The two programs were quite similar also in the amounts of mathematics, applied physics, communications, and production problems which were offered. The job-oriented program did include 230 hours of instruction in machine shop processes.

Though similar in course titles and hours of instruction, the two curriculums were different in that their objective was different. As

suggested earlier, the job oriented program focused on the development of skills and knowledges necessary for on-the-job performance in tool designing. In the field-oriented program emphasis was placed on the success of individuals in each of the courses offered so that application might be made to several occupations within the field of mechanical technology.

The Students

Students were selected from throughout Pennsylvania according to criteria developed by the training institutions. After determining each applicant's eligibility for training under MDTA, election of students was based on graduation from high school or quivalency, familiarity with mechanics or machine operation, expressed desire to be retrained as a technician, and satisfactory aptitudes as measured by the General Aptitude Test Battery. The aspirations of the applicants were confirmed through a series of interviews conducted by the Pennsylvania State Employment Service and the research staff.

The 35 students assigned to the job-oriented program and the 40 students assigned to the field-oriented program were similar in aptitudes, amount of previous education, and age. The work histories of 21 field-oriented and eight job-oriented students did not include mechanical or machine operator experience.

Of the 35 entrants into the job-oriented program, 32 were graduated; 25 or 40 field-oriented students were graduated. Twelve of the 15 who were dropped from the field-oriented program had failed a mathematics or a mathematics based course such as mechanics or strength materials.

Initial Placement

Six months after the completion of training 28 job-oriented and 19 field-oriented graduates were employed in industry. Others were in the military service or school while one from each program was unemployed.

The mean starting salary of field-oriented graduates was $110.00 a week and $96.81 for job-oriented graduates. Percentage wise, the field-oriented graduates were twice as mobile as were the job-oriented graduates. Relative beginning weekly salaries, there was a significant interaction between the training programs and mobility. Mobile field-oriented graduates were earning more than mobile job-oriented graduates and immobiel job-oriented graduates were earning more than immobiel field-oriented graduates. Although many went to work immediately after training, it required an average of almost four weeks for graduates of the two programs to begin their first industrail jobs.

The Continuing Job

Data relative to the behavior of graduates in their jobs were gathered in the evaluation of the training programs. These data were gathered through personel interviews conducted one and two years after completion of training at the employment location of the graduate. The outputs of the job-oriented and the field-oriented training programs were compared on the basis of eight variables. These were: the level of job responsibility, unemployment, mobility, salary, job satisfaction, employer rating, social class identification, and additional training taken.

In determing the job responsibilities of graduates, a job analysis was used to gather data about the work field, skills used on job, job functions, and level of involvement with data, people, and things. The analysis technique was structured by the United States Bureau of Employment Security and used in their preparation of the 1965 edition of the Dictionary of Occupational Titles.

T

Two years after the completion of training, 24 job-oriented and 15 field-oriented graduates were employed in the work fields of drafting and engineering. Other industrially employed graduates were employed in researching, appraising, administering, and machining.

All of the graduates of both programs were using many of the work skills which were specifically taught in the training programs. This was evidenced by the use of drafting, design, and mathematics, and by their job functions. Three-fourths or more of the graduates of both programs were using freehand lettering, sketching, orthographic drawing, sectioning, dimensioning, and scale drawing skills. One-half or more of the job-oriented graduates were designing tools, layouts and templates. The same was true of field-oriented graduates in designing fixtures, jigs, tools, layouts and gauges. Most frequently used mathematical skills were arthmetic, algebra, right triangle trigonometry, and plane geometry.

By observing the output of the worker and asking questions about what he did, how and why he did it, and what skill was involved, the job analyst prepared a job description. A sentence analysis of each job description was prepared to identify the worker's function relative to data, people, and things.

The jobs of the 24 job-oriented and 15 field-oriented graduates employed in drafting or engineering one year after training required copying, computing, compiling, or analyzing data. Twenty-seven of the 39 graduates in drafting or engineering were compiling data. Two years after graduation the level of data involvement had increased for six job-oriented and two field-oriented graduates while decreasing for one graduate of each program.

Seventeen job-oriented and ten field-oriented graduates were not required by their jobs to have a significant involvement with people. Between one and two years after graduation the level of involvement with people had increased for seven graduates and decreased for one.

All graduates of both programs in the work fields of drafting and engineering were precision working with things one and two years after completing training.

There were no significant differences in the level of involvement with data, people, or things between graduates of the two training programs.

During the first year following graduation, there were 16 job-oriented and nine field-oriented graduates who reported that they had been unemployed. These periods of unemployment were as long as 26 weeks for one job-oriented graduate and 21 weeks for one field-oriented graduate. During the second year after training, two-job-oriented graduates were unemployed an average of two weeks each. During this same period, four field-oriented graduates were unemployed an average of five and one-half weeks each. The longest period of unemployment for any individual during the second year was nine weeks.

There was a significant relationship between the time required by graduates to secure their first jobs and the mobility of those graduates. It required an average of .81 weeks for mobile graduates and 5.53 weeks for immobile graduates to begin work after training. Twelve job-oriented graduates made a total of 13 moves during the first year after graduation. Twenty moves were made by 13 field-oriented graduates in that same time. Three job-oriented and four field-oriented graduates ma e one move each during the second year.

Mean weekly starting salaries for field-oriented graduates were $13.19 higher than they were for job-oriented graduates. After two years there was a weekly average difference of $13.18 in favor of the field-oriented group. Two years after graduation average weekly salaries were $120.02 for job-oriented graduates and $133.20 for field-oriented graduates. These average salaries tended to be somewhat lower than salaries for Class B. Draftsmen, as reported in Occupational Wage Surveys.

Five aspects of the satisfaction of graduates with their jobs were measured using the Job Description Index. The satisfaction of graduates with the supervision, promotion, work, pay, and people aspects of their jobs were measured. Although there was no significant fluctuation in job satisfaction scores during the first two years after training, scores tended to be slightly higher on the first measure six months after graduation. Job-oriented graduates were significantly better satisfied with the work aspect of their jobs than were field-oriented

graduates six months and one year after the completion of training. After two years on the job, there was no difference between groups in their job satisfaction.

Supervisors rated the on-the-job performance of graduates one year and two years after graduation. More than one-half of the graduates of both programs were rated above average or outstanding during each rating on manipulative work, personal and social qualities, and work qualities and habits. In occupational technology, graduates of both programs tended to be rated average or above average with the exception of ratings for the field-oriented group on manipulative work. There were larger percentages of graduates rated above average or outstanding after two years on the job than there were the year previous. These upward shifts were accompanied by decreasing percentages of average ratings.

With an abrupt change in occupation, as provided for through retraining, and the relationship of occupation to socio-economic status, it was hypothesized that there would be a change in the social class identification of students. A social class identification scale was administered before training, immediately after training, and two years after graduation. There was a significant increase in social class identification of both training groups between pretesting and post-testing and scores two years after graduation. In other words, the peak social class identification scores occured at the conclusion of training.

During the two year period following training, 12 job-oriented and 12 field-oriented graduates were involved in additional formal education. Two field-oriented graduates were full-time college students while the other 22 were industrial employed and studying on a part-time basis. This additional education included part-time college attendance, company sponsored educational conferences, and formal classes conducted at the place of employment.

Conclusions

This study was an evaluation of two technical education programs for the retraining of underemployed and unemployed workers under the Manpower Development and Training Act. Eight measures of the job related behaviors of former students were used to evaluate the effect of training on individuals with differeing personal characteristics. Some of these findings were interesting because there were differences, while others were interesting because there was no difference between groups.

There was no difference in the level of responsibility held by graduates of the two programs. It was suggested by advocates of field-

oriented technical education that preparation in a broad array of basic subject matter would allow graduates of this program to advance further and to find employment in more occupations. Neither of these things happened. Although the field-oriented program served as more of a screening device by dropping more students, it did not produce graduates who operated at higher levels of involvement with data, people, or things. Perhaps 50 weeks did not allow for adequate field-oriented preparation, or maybe two years on the job did not allow those graduates to find their proper level of responsibility. However, as time goes on the effects of training will probably diminish while the effect of intervening variables will increase.

There were no differences in the amount of unemployment experienced by the training groups as measured by weeks to secure first job or in annual average weeks of unemployment.

When the length of time required to secure first job was compared on the basis of mobility, there was a dramatic difference. Mobile graduates required an average of less than one week to secure their first jobs while immobile graduates required five and one-half weeks. Mobile graduates also appeared to earn more money, but this was confounded by the interaction of the effect of training program. If, as these findings suggest, mobility does make persons more employable, the challenge to educators is to increase the mobility of their graduates.

From first employment through the first two years, field-oriented graduates consistently earned more than job-oriented graduates. As suggested earlier, the effect of training program and the effect of mobility interacted. The graduates of the field-oriented program had higher average weekly salaries, but they were also more mobile.

In most aspects of their work, there was no difference in the satisfaction which graduates of the two training programs derived from their jobs. Job-oriented graduates tended to be better satisfied with the work their jobs included than were field-oriented graduates. This difference was significant six months and one year after graduation. It was earlier speculated that as the level of responsibility rose for field-oriented graduates, their level of satisfaction with their work would increase. However, there had not been a sufficient increase in the level of responsibility for those graduates during their first two years on the job to determine if this was true.

After spending a considerable amount of time in gathering supervisor ratings, it became apparent that these ratings would not be useful in comparing training programs. The ratings were interesting and give some general notion of the acceptability of the graduates, but their reliability is highly suspect. This was largely because an absolute

scale was not provided for ratings and each supervisor rated his employee according to some personal reference.

It was anticipated that social class identification scores would increase over the period of training, but it was not was not expected that they would drop again after two years on the job. This may not be entirely unlike the attitudes of teachers which are most idealistic just before graduation and tend to be less so after some time at work. Perhaps the design technology graduates entered their jobs with an idealized impression of their status, but revised their personal estimates after two years of facing the realities of their work.

There was no difference between training groups in the number of graduates who pursued additional education. This dimension seemed important because of the emphasis on additional education for advancement in technical occupations. Unfortunately, no college credit was given for the course work completed during the intitial training programs, and some graduates found that they had to repeat some course work to advance to a higher level. The earning of an associate or bachelors degree was strongly encouraged in some industrial organizations.

One of the more disturbing aspects of this project was the success of several students who did not fully qualify according to the criteria for selection. It is not disturbing that they succeeded, but it is disturbing to know that there probably were prospective students who were not considered for training because of their credentials who could have succeeded in training.

This project demonstrated that individuals could be selected from the ranks of the underemployed and unemployed and be prepared as technicians within one year. Their acceptability in industry was shown by their rate of employment and the level of their job responsibilities. With selected groups of students preparing in occupational fields with high demands for workers, shortening of the training period should be considred. This would be particularily desirable when students are taken from the labor force for training. This training may not prepare them for employment for the rest of their lives, but it should give them the opportunity for employment in occupations in which they may grow and prepare for change.
